February 8, 2011

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish per month is a realistic value that represents the fish consumption habits of Native peoples in this area.

The importance of fish to the tribes cannot be overstated, for the fishery resource is not only a major food source for tribal members; it is also an integral part of their cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, they rely on the protection and enhancement of water quality to a level that is sufficient to protect water and fish from harmful exposure to waterborne pollutants.

Although not a tribal member myself, I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

Jaqueline Anderson

Portland, OR 97204

Dear Ms. Matzke:

This letter is to express my support for the Oregon Department of Environmental Quality's proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

Andrea Rodriguez

Water Quality

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

Dear Ms. Matzke:

This letter is to express my support for the Oregon Department of Environmental Quality's proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish per month is a realistic value that represents the fish consumption habits of Native peoples in this area.

The importance of fish to the tribes cannot be overstated, for the fishery resource is not only a major food source for tribal members; it is also an integral part of their cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, they rely on the protection and enhancement of water quality to a level that is sufficient to protect water and fish from harmful exposure to waterborne pollutants.

Although not a tribal member myself, I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

Chris Harvey

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish per month is a realistic value that represents the fish consumption habits of Native peoples in this area.

The importance of fish to the tribes cannot be overstated, for the fishery resource is not only a major food source for tribal members; it is also an integral part of their cultural, economic, and spiritual well-being. Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

Timothy J. Greene, Sr.

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

Don E Secena

Andrea Matzke
Oregon DEQ
Water Quality Division
811 SW Sixth Ave.
Portland, OR 97204

Dear Ms. Matzke:

This letter is to express my support for the Oregon Department of Environmental Quality's proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

Brook B. Kristovich
Tribal Member, Native Village of Napaimute

A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.

Sincerely,

Elwood H. Patawa

Portland, OR 97204

Dear Ms. Matzke:

This letter is to express my support for the Oregon Department of Environmental Quality's proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

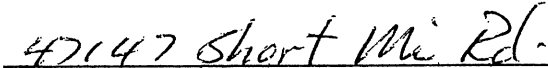

Sincerely,

Dear Ms. Matzke:

This letter is to express my support for the Oregon Department of Environmental Quality's proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

Dear Ms. Matzke:

This letter is to express my support for the Oregon Department of Environmental Quality's proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. Increasing the fish consumption rate beyond the current, non-representative estimate will result in reduced levels of toxic pollutants that are regarded as "allowable" in state waters.

The proposed 175 grams per day fish consumption rate is derived in part from a comprehensive study of the ceremonial and subsistence consumption patterns of Native Americans who reside in, catch, and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz. servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes is immeasurable; fish are not only a major food source for tribal members, but also an essential element of our cultural, economic, and spiritual life and well-being. As ceremonial and subsistence fishers, we rely on protection and enhancement of water quality necessary to protect our fish from harmful exposure to waterborne contaminants.

I believe that the current estimated fish consumption rate, and that proposed earlier, are simply not sufficient to protect the tribal people of the Columbia River Basin and other Oregonians that consume healthy amounts of fish. I urge the Oregon DEQ to adopt the revised 175 gram per day fish consumption rate and water quality standards based on it.

Sincerely,

Michelle DeRocher

Dear Ms. Matzke,

I wish to express my support for the Oregon Department of Environmental Quality (DEQ) proposal to revise state water quality standards based on a fish consumption rate of 175 grams per day. A higher Fish Consumption Rate than is currently recognized by the state of Oregon will result in decreasing the levels of toxic pollution that are considered "allowable" in our rivers, lakes, and streams.

The proposed 175 grams per day fish consumption rate is based in part on a comprehensive study of the ceremonial and subsistence consumption habits of Native Americans who reside in, catch and consume fish within the Columbia River Basin. The results of the study prove that the consumption of twenty-three 8-oz servings of fish meals per month is a realistic value that represents the fish consumption habits of our people.

The importance of fish to the tribes cannot be overstated for the fishery resource is not only a major food source for tribal members'; it is also an integral part of our cultural, economic, and spiritual well-being. As ceremonial and subsistence fishers, we rely on the protection and enhancement of water quality to a level that is sufficient to protect our water and fish from harmful exposure to waterborne pollutants.

I feel that the current estimated fish consumption rate is simply not sufficient to protect tribal peoples residing in the Columbia River Basin or other Oregonians that consume healthy amounts of fish. I urge the DEQ to adopt the new 175 gram per day fish consumption standard.
