- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Lisa Caine

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Please focus on reducing emissions. This is critical at this time. Thank you!

Dear Commissioners,

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
Valerie Snyder  
3311 Valley Crest Way  
Forest Grove, OR 97116

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Melissa Hathaway

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

To whom it may concern,

My name is Josh Mooney from Energize Bend, a grass roots group focused on home electrification.

Thank you Chair George and members of the commission and staff for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

The Climate Protection Program is potentially one of the most significant tools that Oregon has to reduce climate pollution in our state and it has been designed to bring health and economic benefits to the residents of our state. But this program will only be effective if the details of the rules support the purpose of the program.

I am very concerned that DEQ's current proposed rules would effectively undermine the purpose of the CPP and I would remind the commission that this program was adopted with overwhelming public support following an extensive stakeholder engagement process and was designed to benefit the residents of Oregon.

The proposed rules would undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits particularly for environmental justice communities across the state.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane or hydrogen investments and would enable the expansion of new large industrial carbon emitters.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which is produced here in Oregon and provided direct benefits for Oregonians and not allow out of state RNG credits.
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system.
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

These updates are critical to ensure that Oregon stays on track to achieve our climate goals and to maximize the associated job creation, cost saving, public health, and economic development benefits here in Oregon.

Thank you for the opportunity to provide comments.

Josh

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Marian Carter

I am writing to comment on DEQ's 2023 climate rulemaking.

DEQ should amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane that is injected into a pipeline within Oregon;
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

In the current rules DEQ should maintain protective restrictions on biomethane accounting including synthetic methane derived from anthropogenic carbon sources that does not comply with the CPP.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you,

Peter Kokopeli

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Please continue to prioritize communities of color and other vulnerable groups in working to protect Oregon from the impacts of climate change!

Thank you!!

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Members of the Climate Rulemaking Group:

I am emailing as a senior citizen living in a retirement community in Portland who works actively with "green teams" in other retirement communities to try to address the climate crisis for the sake of generations to come. I believe that we all have an obligation to try to leave a livable planet for our children and grandchildren, and that will only happen by taking significant steps NOW.

I am concerned that Oregon's important Climate Protection Program could be weakened by the draft rules that the DEQ has proposed. It is imperative that Oregon do everything it can to reduce carbon emissions and provide benefits to local communities.

**Please adopt rules that maximize benefits to Oregonians.**

Hello,

I am very excited about the Climate Protection Program (CPP), and want Oregon to take big bold action on climate change. To do this, the DEQ needs to strengthen the rules for the CPP. We have a crucial chance to affect Oregon's 30-year plan to reduce carbon emissions.

With the current draft rules, I am most concerned about fossil fuel suppliers being able to buy Community Climate Investment (CCI) credits as a way to meet the greenhouse gas emission cap. Fossil fuel suppliers need to ACTUALLY reduce their emissions by 90% by 2050, not just pay for "renewable" natural gas and hydrogen that still emit fossil fuels. Furthermore, I am concerned about companies being able to buy CCI credits out of state, and continue to burn fossil fuels in the state. Oregonians want clean air in their own communities, and want to receive renewable energy directly, not through an offset program. Out-of-state CCI projects do not create jobs in Oregon. Out-of-state investments allow fossil-fuel suppliers to continue to expand fossil fuel infrastructure in Oregon, which is counter to the values of the majority of Oregonians who want a clean energy future right here in our state.

Thank you for your work on this issue. Please keep the economic, health, and safety benefits of a clean energy transition for Oregonians front-of-mind as you move forward in the rule-making process. We need to hold fossil fuel suppliers responsible and create a real reduction of emissions in Oregon.

Thank you,  
Rachel Osmundsen

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Veena Singwi

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

[You don't often get email from [pcbrandom@everyactioncustom.com](mailto:pcbrandom@everyactioncustom.com). Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Dear Oregon Department of Environmental Quality,

Dear Commissioners, I was a member of the committee that established the Climate Protection Program. It represents the most impactful work that I've been involved with, professionally or personally. The rulemaking process was strong, and the input incorporated into the rules. Most importantly, the DEQ demonstrated without doubt that this program, under the adopted rule, will effectively address emissions from one of the largest contributing sectors.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, while maximizing the associated job creation, cost saving, public health, and economic development benefits.

Change is difficult, and some industries will necessarily have to change under the rule. But I think any doubt of the urgency to reduce GHG emissions has now vanished. It is the greatest problem to ever face Earth and humans.

Thank you.

Sincerely,  
Peter Brandom

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Thank you for considering my input and for doing the right thing.

Benton Elliott, Eugene

September 17, 2023

Department of Environmental Quality,

Dear DEQ Board,

I am a resident of Eugene Oregon and am extremely concerned that human activity of over producing CO2 and other Greenhouse gas emissions into the atmosphere is causing our planet to over heat.

I am also extremely concerned at the direction the DEQ is taking. The Climate Protection Program that was approved last year by the (EQC) is under threat by the inappropriate imbalance of the utility company representation on the Rulemaking Advisory Committee. As you know, of the 14 members, 12 are representing the utilities companies. This will produce outcomes that will bypass the Community Climate Investment fund and will not create a downward trajectory of greenhouse gas emissions. We encourage the position that only hydrogen produced through electrolysis using renewable energy should be acceptable.

We need to take dramatic action to curb the climate emergency that we are clearly facing. I strongly urge the DEQ to maintain the original Climate Protection Program that was approved last year by the Environmental Quality Commission (EQC).

Sincerely,

Tom Peck  
2180 Friendly St.  
Eugene, OR 97405

[You don't often get email from [susapple54@everyactioncustom.com](mailto:susapple54@everyactioncustom.com). Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Dear Oregon Department of Environmental Quality,

I have been so proud of Oregon for promoting and adopting a Climate Protection Program. Now, thank you for the opportunity to provide comment on DEQ's 2023 climate rule-making. This is the critical part -- rule-making. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support. The public was involved over the 18 month process.

Now I have been alerted that the DEQ's current proposed rules would effectively undermine the CPP. Most specifically, it concerns me that the DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, enabling the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

This proposal undermines the entire purpose of the CPP. It would be as though it had not been crafted with such hope and community involvement. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rule-making will have far-reaching consequences for the climate, and communities in Oregon. As a citizen of Oregon and the World, I really don't care if companies can't do business as usual in Oregon. Times have changed. The drought is killing us. All companies who want to do business in Oregon within the energy sector, should know they must abide by the regulations of Oregon's cornerstone CPP. The rule-making is critical and if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits-- ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

The Climate Protection Program (CPP) is a program that is essential in achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support.

I am concerned DEQ's current proposed rules would undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Rich Rodriguez

To whom it may concern,

As a citizen of Oregon I am writing to you about my concern for the new CPP rules being proposed by the DEQ as it is missing key climate justice elements. The CPP must continue to focus on the original goals of reducing greenhouse gas emissions, maximizing public health benefits, and minimizing costs for consumers. Investments should materially benefit Oregonians. We must reduce our emissions and not "offset" them which really isn't a thing to begin with. You also need to hold the big polluters accountable and continue to reduce our carbon footprint.

Thank you

Dear Oregon Department of Environmental Quality,

Groups across Oregon have worked together extensively to draft the current rules for the climate protection program. These rules have balanced business interests with our community well being to best serve our state.

The Department of Environmental Quality's current proposed rules would allow increased industrial pollution in Oregon and weaken our climate protections by allowing for out of state import of biomethane. As a bioengineer, I understand fully that there is a place for biomethane in our energy sector, but importing it from out of state is illogical and reckless. This move would endanger the health of front line communities and make us miss our climate goals. It also would further damage the health and climate of communities outside of Oregon.

I ask that the DEQ amends its proposed rules to exclude the purchase of biomethane from out of state, protecting our local business, environment and health.

Thank you.

Sincerely,  
Dylan Hinson

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

[You don't often get email from emerald.nightfire@gmail.com. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

We live in a world where every resource counts. When are lawmakers and legislation does not uphold basic policy to keep the environment that we have to live in safe, it makes everything just that much more complicated. Many more people are suffering needlessly. It is already happening everywhere around the globe. Sickness and disease are spreading far more rapidly than they ever have in any time. The ocean cannot oxidize, and we're losing more and more plants and animals that contribute to the ecosystem year after year. This will not happen in 20, 50, or 100 years from now, but it is happening right now. We have one planet. If Mars and Venus are not an example of what can happen when greenhouse gases are allowed to go wild, and unchecked within the atmosphere of a planet doesn't scare you, it should. There's not a speck of life on Mars or Venus, and Earth is just that size, yes, it's in the Goldilocks zone, but we still are at risk for this very thing happening on this planet. Natural gas is something that we should've done away with years ago. It's too toxic. It serves no purpose, and this all comes down to money. Yes, I said it all comes down to money. So you can ask yourself which one do you want to keep on doing, breathing and living, or making money. I'm not going to go into all the various reasons why natural gas should be eliminated from society, you know that. I am not going to go into why we should have a neutral carbon footprint, or zero emissions. You already know that. It is high time that the carbon footprint of the United States be one that of a carbon neutral country. It is not that difficult to make this happen. Instead of throwing things into the landfill, recycle them. Mini, Oregonians are doing just that. Now is the time for you to uphold your end of the deal. We have to live in a carbon, neutral world. None of us Oregonians can do anything about anything outside of the United States, but we definitely can affect Oregon. Do what's right, and step on the side of life and living. That's our reality, every single American only wants to live their best life. And all of you people who gained political and economical power, you have a responsibility to provide the means for that best life. Help Oregon to become carbon neutral no later than 2030. We can do it. We can start rolling away our dependency on natural gas, oil, and other non-renewable resources. Please, make the right decision today. Uphold the values, traditions, and more importantly, the spirit of freedom within every American, who bled, fought and died so that we all could live free. Living free does not mean that you have the right to kill us slowly. Living free does not mean you have the right to allow sickness and disease to spread. Moreover, living free does not mean that you have the right to force Oregonians to line your pockets. If you are offended by this, too bad, I don't really care. When you allow a carbon footprint to stay as high as it is, and we keep on relying upon coal, natural gas, oil, and all of these other non-renewable resources, you put us on a path of economic failure, sickness and disease, spreading, and inadequate infrastructure to handle societal collapse. Each and every one can strive to become better. These changes need to be made now. So, now is the time to stand up and do what's right.

Best regards,  
Aprelle Banks

If you can dream it, you can believe it, and if you can believe it, you can achieve it

Hello,

Thank you for providing an opportunity for public comment for DEQ Rulemaking in 2023. I am happy to see DEQ strengthening many areas of the CPP. In particular, I am excited to see Stationary Sources be included within this regulation, but I have a few concerns.

The amendments and rulemaking allow for book and claim of H2 injections based on the H2's carbon intensity. I like that this part of the regulation acknowledges the broad range of GHG emissions from H2 production based on the process and feedstock used.

However, when it comes to stationary source reporting, I am concerned with the definition of "Direct GHG emissions" in the Division 215 of the GHG reporting program as used in section 2 of 340-215-0030 and defined in sections 19 and 30 of 340-215-0020. These definitions exclude the consumption and emission of H2 for industrial processes. This concerns me because it makes it optional for large H2 consumers to report their H2 associated GHG emissions.

I understand that there can be a risk of double counting because H2 producers in Oregon will also have to report their CO2, but this policy choice poses several risk:

1. Stationary Sources could use carbon intensive H2 as a feedstock, fuel, or inert gas emitted directly to the atmosphere. In other words, Stationary Sources can keep emitting by using cheaper high carbon intensity H2 produced out of state and shipped in.
2. Without incentivizing Stationary Sources to use less carbon intensive H2, this could make Oregon H2 producers less competitive because they won't have consumers for low carbon intensity H2. This could lock out Oregon from getting the benefits from this industry growth as this technology becomes more developed because they won't have as large of an initial market.
3. We may fail to monitor Stationary Sources that are actually large emitters (>2500 MT CO2e if H2 associated emissions are concerned) if they are using a lot of more carbon intensive H2 that is not included in the current definition of "Direct GHG emissions". This is of particular concern for the semiconductor industry which uses large amounts of high purity (high value) H2 for a variety of purposes.

This could be fixed if the DEQ makes H2 consumption tracking mandatory for stationary sources that qualify and include the CO2e of that H2 in the emissions of those stationary sources. This will help incentivize the use of low carbon intensity H2 in industry.

My other major concern is how new entrants (new stationary sources) get evaluated on their initial CO2 caps. The best opportunity to lower emissions is at the design phase. This means that new construction should be subject to lower caps for their economic productivity than older facilities in the same industry. These expectations need to be clear for businesses.

Thank you again for doing this work. It is crucial for the health of our state and the future of

Oregonians to get this right. I hope you find this public comment helpful.

Best regards,  
Adam

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
William Heerdt

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Juanita Rinas

**Subject:** Strengthen the proposed 2023 climate rules

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
David Medford

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Tonya Stiffler

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Monday, September 18, 2023 5:27:27 PM

---

You don't often get email from [robbschindele@advocatefor.me](mailto:robbschindele@advocatefor.me). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

In short, please make sure your final rules maximize benefits to the public and minimize benefits to polluting industries.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Robert Wright

Dear Oregon Department of Environmental Quality - 2023 CCP,

Corporations have to be held accountable for their part in the destruction.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Charlie O'Neill

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Susan Delles

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Diane Luck

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Blythe Clark-McKittrick  
514 SE Belmont St  
Portland, OR 97214

Dear Oregon Department of Environmental Quality,

I am 18 years old and already dealing with the effects of climate change that politicians said wouldn't happen until generations into the future. Summer has turned from a time of vacation and relaxation into three hellish months hiding indoors from wildfire smoke. Now is not the time to be gutting climate protections. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. I am concerned that DEQ's current proposed rules would effectively undermine the CPP.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Tascha Babitch

**To:** 2023 Climate \* DEQ  
**Subject:** The Climate Protection Program needs to be strengthened not weakened

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on the Department of Environmental Quality (DEQ)'s 2023 climate rulemaking. Oregon's Climate Protection Program (CPP) is vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I am concerned that the DEQ's current draft rules will weaken Oregon's Climate Protection Program. Specifically, I am concerned that DEQ's current draft rules

- would allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Biomethane used for CCP compliance needs to be restricted to only biomethane that is injected into a pipeline within Oregon.
- would not ensure that the hydrogen counted for CPP compliance is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.
- would enable the expansion of new large industrial emitters without their being accountable for their greenhouse gas emissions. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger Climate Protection Program that prioritizes benefits for Oregon's families and communities.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Deborah Clark

**Subject:** Strengthen the proposed 2023 climate rules

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Mary McGaughey

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

[You don't often get email from campaigns@good.do. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Aya Vitello

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Roxanne Dalton  
13060 SW Carmel St  
Portland, OR 97224

As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Please continue to push to prioritize our health and the health of our planet by meeting these goals.

Sincerely,  
Catherine Reynolds

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Linda Ramachandran

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Dana Weintraub

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Laura Ladd

- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Your agency is first and foremost accountable to the ordinary people living in Oregon, not the corporate polluters. You must implement the program as intended, reducing pollution and the rapid degradation of our climate. Thank you.

Sincerely,  
Norma Silliman

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

I agree with this petition. Do not aspire to be Seattle or the State of Washington. They destroy Whistleblowers and allow their government to behave like Amazon. WASHINGTON STATE DEPARTMENT OF HEALTH IS MISOGYNISTIC AND DESTROYS WOMEN'S LIVES.

Sincerely,  
Nina French

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Air pollution is linked to one in five deaths worldwide.  
Clean air is a basic human right. Help us protect it!

Sincerely,

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

You don't often get email from [chanzepants@grassrootsmessage.com](mailto:chanzepants@grassrootsmessage.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Chanze Kratz

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Bridget Wyatt  
783 NW Naito Pkwy  
Portland, OR 97209

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Hi there,

Thank you I'm advance for taking the time to read my message.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

Kindly,  
Drew

**Sent:** Tuesday, September 19, 2023 7:46 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Marissa Wolfheart

Dear DEQ;

I support a stronger Climate Protection Plan, not a weaker one. I understand big polluters would like to weaken the CPP. In my view, this would be most harmful for our environment which is under threat from ever worsening pollution and emission of harmful greenhouse gases.

Please do not bow to big polluting companies' pressure tactics!

Sincerely,

---

[You don't often get email from kwautomail@phone2action.com. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Dear Oregon Department of Environmental Quality - 2023 CCP,

However, you MUST do MUCH more. We MUST keep ALL climate-changing fossil fuels IN THE GROUND! We MUST achieve 100% clean, renewable energy like solar and wind in electrical generation and transportation by 2030.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Art Hanson

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Ben Basin

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Lauren Koentje  
1337 10th St

To whom it may concern:

I am a senior living in a retirement community overlooking the lovely Willamette River. I understand that Oregon's Climate Protection Plan (CPP) is under assault from big polluting companies. Please do not allow these companies to weaken the CPP. It's important to me that we work towards a cleaner environment, not simply for myself but for my family and the families of our state, now and for decades to come.

Respectfully,  
Rosalyn Gallo

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Karen Smith  
Corvallis, Oregon, 97330, United States

Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Jean Vinson

**Date:** Wednesday, September 20, 2023 10:47:27 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Dear Oregon Department of Environmental Quality - 2023 CCP,

Carbon offsets are a good idea in the right hands. It appears, however, that industry has found ways to continuing their worst polluting ways while claiming carbon offsets in other States. Oregon should restrict any such offsets within the State to State-certified projects that benefit Oregon's fight against climate change.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. **From:** [Christine Gillen](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 10:51:01 AM

---

You don't often get email from christinegillen3@advocatefor.me. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Christine Gillen  
1627 NE 120th Ave  
Portland, OR 97220

**Date:** Wednesday, September 20, 2023 10:52:23 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

If we're lucky, we're still at a tipping point (and not beyond it). Now is the time for real action to stop fossil fuel destruction of an environment that supports human survival.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Leslie Pincus

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Tracy Richards

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 11:04:56 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Climate change is a crisis and we need to respond in all the ways possible to make changes that benefit our communities while adding to efforts to protect the climate. We must act now in both large and small ways.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 11:11:43 AM

---

You don't often get email from rat444tar@advocacymessages.com. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Tracy Hartse

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Steve Sheehy

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 11:19:41 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Mary Thiel

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 11:27:15 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

NO MORE LOOP HOLES. ROBERT and IRENE JESSEN

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 11:49:10 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Maureen O'Neal

**From:** [Dave King](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 11:55:58 AM

---

You don't often get email from [davewaveking@advocatesmessage.com](mailto:davewaveking@advocatesmessage.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Dave King  
8716 N Edison St  
Portland, OR 97203

**Date:** Wednesday, September 20, 2023 11:56:46 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 12:13:19 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Don't let out of state actors pollute Oregon, causing harm to our citizens and environment. Diana

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Diana Pace

Dear Oregon Department of Environmental Quality - 2023 CCP,

I live in a home that has been in our family for over 60 years. This year is the 1st year our cistern has ever run dry. It is also gotten so hot, that even on the coast, we have had to add a heat pump to remain cool. We have also seen beloved trees die from the high temperatures. The creek beds are dry and we are seeing more deer coming on the property looking for water. Loopholes that allow the fossil fuel industry to continue to pollute and contribute to this climate crisis should not be on the table. We need viable strategies that will lead us to renewable, clean energy, and the DEQ plays a key role in getting us there.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 12:30:30 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Carrie McGranahan

I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Mary Lynn Willis Parodi

**Date:** Wednesday, September 20, 2023 1:02:12 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Alton Roundy

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 1:31:57 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Please get serious right now about reducing carbon emissions in our state.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**From:** [Rena Philbrook](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 2:06:53 PM

---

You don't often get email from [renablacketer12@yourconstituent.com](mailto:renablacketer12@yourconstituent.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Rena Philbrook  
4657 NE Johns Ave  
Neotsu, OR 97364

**Date:** Wednesday, September 20, 2023 2:14:07 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 2:36:01 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 3:20:52 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Jeanne Brooks

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 3:40:05 PM

---

You don't often get email from [albanydog@advocatefor.me](mailto:albanydog@advocatefor.me). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
DL Chipman

**From:** Valerie Snyder <campaigns@good.do>  
**Sent:** Wednesday, September 20, 2023 4:44 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Valerie Snyder

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 4:45:52 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Marilee Corey

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 5:04:36 PM

---

You don't often get email from [seay.jeanne@advocatefor.me](mailto:seay.jeanne@advocatefor.me). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Jeanne Seay  
84017 Brown Rd  
Dexter, OR 97431

Dear Oregon Department of Environmental Quality - 2023 CCP,

Offsets in other states do nothing to protect Oregonians. Polluters need to conform to OR laws (CPP). Heat, wildfires, floods, air and water pollution are putting people at risk! You don't need MORE \$\$ ? you need MORE integrity!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Prioritize justice in Climate Protection Program implementation  
**Date:** Wednesday, September 20, 2023 6:41:20 PM

---

You don't often get email from [jessicajvaughan@gmail.com](mailto:jessicajvaughan@gmail.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

OR

Sincerely,  
Jessica Vaughan

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Johanna Hand  
4637 NE Cleveland Ave  
Portland, OR 97211

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 7:55:48 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Scotty Johnson

To the members of the DEQ Climate Protection Plan rule-making committee,

As a rural Oregonian who had previously expressed my encouragement to the DEQ to develop the Climate Protection Plan, I am outraged and frustrated that the rule-making process is being co-opted largely by representatives of energy corporations who are manipulating the plan to serve the profit interests of the fossil energy industry!

I urge you to ignore the efforts of the gas utilities to bypass the Community Climate Investment (CCI) fund by incorporating out-of-state Renewable Natural gas into their product and evading the CCI focus on promoting social justice in Oregon. We need the Best Available Emissions Reduction rules to keep industry on a steep downward trajectory in emissions. Lastly, if we are to move forward with the use of hydrogen, that we do so only using hydrogen produced through electrolysis using renewable energy.

I encourage you to think and act from a place of moral conviction, from what you know in your heart to be the right thing to do.

Thank you,  
Rev. Elizabeth L. Olson

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 8:35:35 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Linda Donnelly

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 9:31:18 PM

---

You don't often get email from wehrleym55@advocatefor.me. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, September 20, 2023 9:57:50 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

We don't have time for this nonsense. Stop the pollution! Stop the free ride these people have been getting. Make them pay through the nose for what they've already done and stop letting them do more!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Deb D'Andrea

**Date:** Wednesday, September 20, 2023 10:37:42 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Don't allow companies to pay to pollute. We need to ensure we move forward in reducing climate chaos emissions.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Wednesday, September 20, 2023 11:48:29 PM

---

You don't often get email from [onaiaziz1@advocatesmessage.com](mailto:onaiaziz1@advocatesmessage.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Marlene Olveda

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Thursday, September 21, 2023 6:46:07 AM

---

You don't often get email from [williamhamilton712@sendgrassroots.com](mailto:williamhamilton712@sendgrassroots.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
William Hamilton

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Thursday, September 21, 2023 6:59:42 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

1. TODAY most rural areas burn their garbage. 2. 100+ million vehicles emit terrible pollution because they've never been tuned up in 10 to 40 years. 3. Many states have no vehicle pollution check (even if only every 5 years would be sufficient). I personally know this because daily I run into 500 vehicles i can see smoking and can smell the pollution. 3. One home with a wood stove in my city makes the entire city smell like campfire smoke and we can see the smoke. Multiply that times millions of wood stoves in USA. But i'm WOKE!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Jesse Burke-Quinn

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

These changes are critical to effective implementation of a climate plan and reducing emissions. Thank you for your consideration.

Sincerely,  
Jennifer Kain

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Susan Eisman

---

You don't often get email from agentsassysquirrel@hotmail.com. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Alice West

**From:** William O'Brien <campaigns@good.do>  
**Sent:** Thursday, September 21, 2023 3:14 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
William O'Brien

**From:** [Sue Craig \(sueacraig@gmail.com\) Sent You a Personal Message](mailto:sueacraig@gmail.com)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Thursday, September 21, 2023 3:43:19 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Please help US...we the people. You have the power to help bring this climate problem under control. Please use the power to significantly decrease the use of fossil fuels. Thank you. Sue Craig

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Sue Craig

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Jennifer Murphy

**From:** [Yael Warshai](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Prioritize justice in Climate Protection Program implementation  
**Date:** Thursday, September 21, 2023 5:28:47 PM

---

You don't often get email from [yael.warshai@gmail.com](mailto:yael.warshai@gmail.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Yael Warshai  
2014 SE Yamhill St  
Portland, OR 97214

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Thursday, September 21, 2023 6:31:21 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Courtney McCoy

**To:** 2023 Climate \* DEQ  
**Subject:** PLEASE Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Mary Bosch

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

I am writing to urge you to make rules which do not allow corporations to increase emissions. The Oregon DEQ should return to its original Climate Protection Plan and ignore efforts by the gas utilities to bypass the Community Climate Investment (CCI) fund by incorporating out-of-state Renewable Natural gas into their product. This would evade the CCI focus on promoting social justice in Oregon. The Best Available Emissions Reduction rules keep industry on a steep downward trajectory in emissions, and encourage the position that only hydrogen produced through electrolysis using renewable energy should be acceptable.

I trust you to truly stand up to the big moneyed interests and protect the environmental quality of our beautiful state.

I am a rural Oregonian and I am concerned about the climate crisis. Thank you,  
Rosanne Lewis

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**From:** Alice West <campaigns@good.do>  
**Sent:** Friday, September 22, 2023 8:11 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Alice West

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Something needs done immediately no waiting around on this one!

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, September 22, 2023 9:50:44 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Laura Hanks

Department of Environmental Quality,

Thank you for the opportunity to comment on DEQ's 2023 climate rulemaking. This rulemaking will have far-reaching consequences for the climate and communities in Oregon. Especially BIPOC, the working class, and especially the next generation.

My name is Karen Caudillo Roman. Adelante Mujeres is working to build a more just society by empowering Latine Women to lead, for Latine women and their families, generations of poverty, racism, sexism, and isolation have limited opportunities for empowerment. I've worked at Adelante Mujeres for almost two years now. I launched our first Environmental Justice Leadership Program with our first cohort this year with the support of Metro's Community Enhancement Grant. Our community is worried about our environment. We know that we are a part of one of the most impacted groups in the state.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program essential to achieving our state's climate pollution reduction goals and adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments and expand new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, thereby hindering benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly regarding emissions reduction – if it's produced from fossil fuels out-of-

state, it could be *more* polluting than even natural gas.

- Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Doing so will help ensure that Oregon stays on track to achieve our climate goals and maximize the associated job creation, cost-saving, public health, and economic development benefits—ensuring that they benefit Oregon communities and are not exported out of state. Our state should prioritize our communities over special interest groups. Please strengthen the proposed 2023 Climate Rulemaking.

Thank you for the opportunity to provide comments.

In solidarity,

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Phil Houston Goldsmith

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, September 22, 2023 11:17:50 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Valerie Snyder

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Alicia Liang

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Friday, September 22, 2023 11:24:07 AM

---

You don't often get email from [robbinschindele@yourconstituent.com](mailto:robbinschindele@yourconstituent.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Robbin Schindele

Hello,

As a resident of Yamhill County, in this beautiful state of Oregon, I believe the rules that the DEQ are proposing for the CPP are missing the following key elements:

- **reducing greenhouse gas emissions** and other air pollutants, **maximizing public health** benefits, and **minimizing costs** for consumers in environmental justice and other communities in Oregon.
- keeping economic and health benefits of the Community Climate Investment program in Oregon: **investments should materially benefit Oregonians** rather than paying for cheap offsets in other places.
- **real reduction of emissions** by 50%, rather than allowing companies to invest in “renewable natural gas” (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- **holding big polluters accountable** to engage in science-based “best available emissions reductions” (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.

I firmly believe that these original goals are what the CPP should focus on.

Thank you for your time, and for listening today.

Sincerely,

Department of Environmental Quality,

Thank you for the opportunity to provide comments on DEQ's 2023 climate rulemaking.

By designing guidelines for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring that our state stays on track to achieve our climate goals. However, given the broad scope of issues and laws touched by this proceeding, there could be serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.

Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be *more* polluting than even natural gas.

Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you again for the opportunity to provide comments.

Dear Ms/Sir:

I urge ODEQ to return to its original Climate Protection Plan and ignore efforts by the gas utilities to bypass the Community Climate Investment (CCI) fund by incorporating out-of-state Renewable Natural gas into their product and evading the CCI focus on promoting social justice in Oregon,

I insist that the Best Available Emissions Reduction rules keep industry on a steep downward trajectory in emissions.

I urge you to ensure that only hydrogen produced through electrolysis using renewable energy should be acceptable.

Please consider my comments as a rural Oregonian.

Sincerely,

John Hamilton

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, September 22, 2023 3:22:13 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Anna Cowen

Hello, I am an Oregon resident and offer the following comments on the Climate Protection Program rulemaking recommended by the Advisory Committee. It's very disappointing to know that the agency appointed an Advisory Committee stacked with energy industry representatives rather than folks committed to a rigorous effort to implement the CPP as conceived by the Executive Order 20-04 and recommended by EQC. It's no surprise that the proposed rules by the Committee are clearly calculated to undermine the CPP and the need to protect Oregon's environment and economy in the face of climate change. I urge you to reconsider these proposed rules and redraw them with an eye to a rigorous enforcement of CPP as called for by EQC. You after all are the agency tasked with protecting Oregon's environmental quality and to that end to implement the Executive Order.

I urge you to reject the proposed rules, in particular, where they allow unrestricted offsets from investment in biomethane projects out of state, contrary to the Community Climate Investment fund. This will not reduce emissions in Oregon and will compromise the environmental justice goals of CPP.

There are also no restrictions on how hydrogen is produced. This is a serious concern as it could be worse than the fossil fuel it replaces.

Finally, the Best Available Emissions Reduction rules imposed on large industrial emitters should not permit an industry to increase its emissions by increasing production. This would seriously undermine emissions reduction. Surely you can see that. We need to make real efforts to reduce GHG emissions, and I call on you as DEQ to be zealously committed to that.

Thank you.

Laura Allen  
Seaside, Oregon

**Subject:** Critical: Strengthen the proposed 2023 climate rules

**Follow Up Flag:** Follow up  
**Flag Status:** Completed

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Laura Rogers  
Portland, Oregon, 97202, United States

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Friday, September 22, 2023 4:52:30 PM

---

You don't often get email from nobodyishome789@advocatesmessage.com. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Danielle Foreman-Smith

Eric Robinson  
135 East 33rd Ave  
Eugene, OR 97405  
September 22, 2023  
Phone: 541-206-3933

To Whom It May Concern,

I hope this letter finds its way into the hands of those who share my deep commitment to the preservation of Oregon's natural beauty and the fight against climate change.

As a long-time resident of Oregon, I have witnessed firsthand the incredible work undertaken by the Oregon Department of Environmental Quality (DEQ) to protect our state's invaluable environmental resources. Over the years, my perspective on environmental matters has evolved, leading me to recognize the pressing need to address climate change and safeguard our environment for generations to come.

Today, I am writing to express my heartfelt concern regarding DEQ's current proposed rules. It has come to my attention that these rules may inadvertently create opportunities for regulated gas utilities to capitalize on out-of-state biomethane investments, potentially enabling the expansion of new large industrial emitters in Oregon. This prospect deeply troubles me, as it undermines the progress we have made in recent years to reduce our state's carbon footprint and transition to cleaner, more sustainable energy sources.

I implore all those involved to consider the long-term implications of these proposed rules. Striking a balance between economic growth and environmental preservation is of paramount importance. I firmly believe that Oregon has the potential to set an example of how a state can thrive while prioritizing environmental responsibility.

Moreover, it is my sincere hope that we not only maintain but also strengthen the Oregon Climate Protection Program (CPP). This program represents a critical step in our fight against climate change and should be upheld as a cornerstone of our state's commitment to environmental sustainability.

Furthermore, I extend an invitation to potential DEQ employees and state representatives who hold the power to influence legislative decisions on this matter. Oregon presents a unique opportunity to contribute to meaningful change and lead the way in environmental stewardship. By joining our efforts, you can be part of a movement that not only protects our environment but also creates a sustainable future for our state's residents.

In conclusion, I urge all stakeholders to reconsider the proposed rules and ensure they align with our shared commitment to combating climate change, preserving Oregon's natural beauty, and strengthening the Oregon Climate Protection Program. I remain hopeful that, collectively, we can discover innovative solutions that benefit both our environment and our economy.

Thank you for your attention to this matter, and I look forward to a future where Oregon continues to shine as a beacon of environmental responsibility.

Sincerely,

Eric Robinson

Subject: 2023 Climate Rulemaking

To DEQ,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

I have concerns that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon, and this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

Please strengthen the proposed 2023 climate rules.

Sincerely,

Robin Bloomgarden  
3690 Wood ave  
Eugene, OR 97402

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
George Stevenson  
Portland, Oregon, 97230, United States

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, September 22, 2023 9:46:03 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Please hold industry accountable for their polluting. We have no excuse for letting them pollute our lands.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Heidi Gerson

---

You don't often get email from [carl.shoemaker@grsdelivery.com](mailto:carl.shoemaker@grsdelivery.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Carl Shoemaker

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Saturday, September 23, 2023 9:58:24 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

GHG Reductions used for CPP compliance must only be allowed if they produce direct benefits for Oregonians. Currently Northwest Natural Gas asks me - a customer- to pay extra money each month so that they can buy GHG credits from greenhouse gas sold by businesses in other states. WE will not do that- but many people may think they can help the climate by doing so. It is very deceptive.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Doris Cellarius

**Sent:** Saturday, September 23, 2023 10:51 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
KIMBERLY BEELER

**From:** [Molly Shippy \(mollyms55@msn.com\) Sent You a Personal Message](mailto:mollyms55@msn.com)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Saturday, September 23, 2023 12:45:39 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Molly Shippy

Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP – a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Sincerely,

Juanita Rinas

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Dave King

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Lindsey Rickert  
4225 N Juneau St  
Portland, OR 97203

We have long since run out of time to preserve the Oregon I knew as a child in the 1950s. Please, please delay no longer in aggressively tackling climate change. Some of us have been doing our best, in both small and large ways, to live simpler lives, to give up driving, to live in small spaces that need very little energy to heat, as well as encouraging/pushing the powers that be to act in the big ways only they can act - usually unsuccessfully.

In the CPP rule making process please make up for years of inaction by coming down HARD on regulated industries that would like to weasel out of restrictions. Many industries have lost out historically or reinvented themselves. It can be done again. Some folks may suffer in the short term but the long term suffering that will be inflicted by uncontrolled climate change will be FAR WORSE. I beg you to stiffen your collective backbones and stick with the strictest possible rules in this round of rule making. History, as well as your own children and grandchildren, will thank you.

Sincerely,

To whom it may concern,

Let's not AGAIN go backwards due to old ways of doing things! The DEQ must ensure the Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities. Specifically, it is vital that DEQ strengthen its current proposed rules by: 1. Restricting biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians. 2. Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Economic pressure to change these laws will mean NOTHING when OUR planet is no longer viable.

PLEASE do the right thing!

Dr. Melanie Carlone

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Good Day

This E letter to this body, is to support true possible adjustments necessary, not based on ideology, but the ethos and values of all of us in Oregon.

This process will be though the inclusion of documents, one peer reviewed and published, and reports on treaty failure and the resulting consequences. Since most actions by this body come from policies created by Federal policies, material which seems oblique to the conversation is in fact directly related to the ongoing “climate” community.

To the documents:

1. Research into Carbon as an element, beginning in 1957. This document is an accurate accounting of Revelle and his research, and more importantly for the introspection of those who believe in the “science” of CO2 as a toxin or necessity to generate draconian controls to modify, the co-opting by two individuals to regenerate into a push tool to force policies not in evidence. Please note the document was produced in 2009.

1.

2. The documents here are from Gordon Fulks an Astrophysicist who is in residence in Oregon. The basic point of the issues noted in his observations are he is not a “Federally Paid Scientist”.

2.

2.a

3. This document, while mildly more of a media view, encapsulates the questioning of CO2 program, as a true function of other than wealth distribution. This is not meant to denigrate, but remove the Carbon Tax

racketeering which simply adds burden to the Oregon Taxpayer in policies not in true evidence of need.

3.

4. One issue in bodies such as this that must be addressed is use of commission and omission, in the choice of winners and losers. This Peer reviewed and published document, with all respect, should be involved in policy discussions. The implications are clear to both the introspection and intent of the use of this treaty in ways not intended. This affects your decision process. A quick reread of Document # 2, ( the false premise ) puts society at unnecessary risk.

*At this juncture, the issue of “siloining” is necessary. Siloining is the control of information vertically by entities, while other entities operate horizontal, thus allowing data and information to be disseminated narrowly to one group, and broadly to another. To that end, two documents that appear unrelated are being included, as they in fact are the beginning of the process this body is engaged in without implicit knowledge.*

5. With all respect, what must be understood, is the road to the point you have arrived, is making decisions based on false premises, not your fault, but promoted by ideological interests. This powerpoint, ( Oregon Specific ), was built 14 years ago, and proven by the now obvious discussions by scientists refuting the United Nations ( and WEF ), Blackrock, and others. In the event time is an issue, note page # 13, and the intent of the little known “Wildlands Project”. The United Nations Environmental Program in 1995 published demands noted. I have the 1100 page publication in my library.

5. Historical Timeline: [http://www.slideshare.net/slideshow/embed\\_code/28345505](http://www.slideshare.net/slideshow/embed_code/28345505)

6. In an attempt to provide value to society, and to Oregon specifically, as my home, this map is one page and visual interpretation of the attempted control through the “Wildlands Project” created with cover of the “Biodiversity Treaty”, that was in fact rejected by the Senate and brought back, through the “Sustainable Development” policies, which are in fact not Congressionally mandated.

In conclusion, from the beginning years ago, the road leads to the false premisses that are propelling the

slow destruction of our Constitutional Founding Documents through deceit. Questions feel free, for comment does not provide the value of documentation, to the true need of integrity in decision.

With abiding respect

Lieutenant Robert K. Powell GDO ( Ret ) ph: 971-275-0510  
137990 S Mueller RD

**Sent:** Sunday, September 24, 2023 at 02:11:48 PM PDT  
**Subject:** Strengthen proposed 2023 climate rules

To Whom This Concerns:

Thank you for hearing my comment on DEQ's 2023 climate rulemaking.

Oregon's Climate Protection Program (CPP) rulemaking is critical to ensuring our state achieves our climate goals, and delivers public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments; and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregonians, their local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

As an Oregonian who suffers asthma, I could speak from my own self interest and simply state that continued degradation to our air quality is not an option. Without clean air and clean water, we, collectively, will have no true quality of life here. As an Oregonian who is committed to addressing the devastation to our biodiversity, ecosystems, climate and air and water quality, I urge you to not allow biomethane or hydrogen to increase our states emissions, or to weaken our compromise our CPP in any way.

Sincerely,  
Kim Davis  
97306

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Sunday, September 24, 2023 3:39:32 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

You don't often get email from sarahrochellebaker@gmail.com. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Sarah Baker  
4304 NE Holman St  
Portland, OR 97218

**From:** Chuck Gehling <campaigns@good.do>  
**Sent:** Monday, September 25, 2023 8:48 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Chuck Gehling

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Monday, September 25, 2023 9:10:58 AM

---

You don't often get email from leannes40@advocacymessages.com. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Sincerely,

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**Subject:** Will DEQ's draft rules Help or Hurt Oregon's Climate Protection Program.  
**Date:** Monday, September 25, 2023 2:04:51 PM

---

[You don't often get email from [feuerle@everyactioncustom.com](mailto:feuerle@everyactioncustom.com). Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

OR is still 19% short of meeting our 2020 emissions reduction target, & lacks policies to put us back on track to achieve Biden's nationally determined contribution (NDC) commitment to slash U.S. emissions in half from 2005 levels by 2030. If Oregon doesn't develop additional policies & programs to reduce greenhouse gas emissions, we risk lives & livelihoods.

We must increase climate action & not miss any opportunities to strengthen Oregon's climate programs.

The OR Climate Protection Program (CPP) is only the 3rd in the nation to place an enforceable, declining cap on emissions from transportation & natural gas fuel usage. This program is critical for holding polluters accountable, & we must not accept any weakening of the CPP.

I am very worried that the DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

(1) ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS. DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I BEG the DEQ to restrict biomethane used for CPP compliance to be limited to producing direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in our compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

(2) REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP. All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters

accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Sincerely,  
Phillip Callaway

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters

accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Sincerely,

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Monday, September 25, 2023 5:00:00 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Any sort of fossil fuel or loop hole that allows it, or any other nastiness that does our planet no good, should be shunned and banned! Come on people. This is our ONE life on our ONE EARTH!! Let's get on our A games!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of ?book and claim? accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Pamela Rislove

Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Sincerely,  
Catherine Keys

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

## To Whom It May Concern at Oregon's DEQ:

I write in support of strong rules for the Climate Protection Program (CPP), passed in December of 2021, to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more.

I am a mother and grandmother deeply concerned about the right of all children to live and prosper with confidence in a viable future.

Since the CPP originally integrated robust community input, I was dismayed to read that the recent rule-making table did not, nor has it met the plan's original goals of

- (1) reducing greenhouse gas emissions by 50%,
- (2) providing meaningful investments to benefit Oregonians, and
- (3) holding big polluters accountable.

Big polluters should be held to account to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and to deter development of new stationary sources in Oregon. Accountability must include stakeholder and frontline community input.

We cannot afford to kick the can down the road. In every locale around the globe, we must do our part by adopting decisive policies to slow and reverse the growing Climate Crisis. Even those opposed to forward-thinking policies will benefit, as will their offspring.

Let's make Oregon a leader in this urgent endeavor and help provide a livable future for humans and all other remaining species.

Please adopt rules for implementation of the CPP that restore its original goals.

Thank you,  
Emily Polanshek, Multnomah County 97219

**From:** Theodora Tsongas <campaigns@good.do>  
**Sent:** Tuesday, September 26, 2023 11:45 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate, health, and life of communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Dr. Theodora Tsongas  
Portland, Oregon, 97215, United States

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Sincerely,  
carl tegethoff

**From:** Amy Fvorak <campaigns@good.do>  
**Sent:** Tuesday, September 26, 2023 3:51 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Amy Fvorak  
Wilsonville, Oregon, 97070, United States

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

We are at a true reckoning time for the climate crisis. We can either collectively act boldly now, or suffer the consequences later, including the guilt of leaving a potentially inhabitable future home for our kids and grandkids. This isn't about an abstract future any more. This is about now, and the futures of young people who are alive right now.

The DEQ's passing of the Climate Protection Program (CPP) is a great thing. The CPP will require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Tyler Gilmore

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Aya Vitello

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Tuesday, September 26, 2023 9:35:46 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Katie Abbott

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Elaine McFarlane

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Elizabeth and Nicole,

Good morning.

I have been reviewing the proposed Climate 2023 Rulemaking and the ongoing efforts to promulgate regulations surrounding the implementation of HB2021 in Oregon. I was hoping to connect with you to better understand how DEQ views / treats net-zero GhG power generation at generation capacities beyond 25 megawatts.

My contact information is below, and I look forward to being able to connect.

Best,

Scott

## **DEQ Rulemaking Comments**

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

The proposed rules would undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits particularly for environmental justice communities across the state.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane or hydrogen investments and would enable the expansion of new large industrial carbon emitters.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which is produced here in Oregon and provided direct benefits for Oregonians and not allow out of state RNG credits.
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system.
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Dear Members of the DEQ rule-making committee,

Thank you for the opportunity to submit testimony on DEQ's 2023 climate rulemaking.

I am concerned that the current concessions to regulated industries allow out-of-state RNG bio-methane investments and could enable the expansion of new large industrial emitters, defeating the goals of the Climate Protection Plan (CPP). The current proposed rule amendments will compromise the program's intended public health, economic, and employment goals, and hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

I also ask that you strengthen the emissions reduction requirements for new or expanded stationary source facilities in Oregon under the BAER Act. These large emitters must pivot to use their economic base to be part of the solution, not part of the problem.

This rule-making is vital to ensure this program stays on track to achieve its stated climate, public health, and economic goals. You are in a crucial role to make sure this actually happens.

Thank you for considering this testimony.

Martha Dragovich

TO: DEQ

I appreciate that you are looking at and taking into consideration the public's comments on the Climate Protection Program proposed rules since they overwhelmingly supported a strong Program. I am not an employee of any company that has a financial interest in this policy, just very

concerned about our deteriorating climate and all it brings.

The Dept. of Environmental Quality in Oregon needs to stand for only the best policy for restoring our balanced climate. I am new to Oregon but have seen efforts to undermine state climate policy by natural gas interests in two other states I have lived in.

Don't let that happen here, please.

First I am very concerned that the rules are not specific enough on the type of hydrogen that might get invested in. Only "green" hydrogen in the truest sense should be allowed. It should be spelled out specifically. Otherwise, you will make climate pollution even worse

Next, I see that biomethane - again be very clear on how well it is captured - from even out of state might suffice for getting a RNG credit. So many ways that is wrong. The economic and health benefits only then go to citizens outside the state, except for some investors or company executives.

Finally, new or expanded stationary source facilities must be pushed in the policy rules to conform to even stronger emissions requirements. So, that should be spelled out more clearly in the Best Available Emissions Reductions Program.

I don't think the Oregon public will be happy with a compromised Climate Protection Program.

Thank you for this opportunity to give my thoughts about the CPP proposed rules.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Dept of Environmental Quality,

There are two very important requests that I would like to make in order for our community to thrive over the long term. Our health and safety is threatened by the continued uninhibited use of oil and gas in our world. We need to make it a priority to find alternatives and to limit the byproducts of oil and gas production now.

Please restrict bio methane (RNG) and hydrogen in order to comply with CPP.

Also strengthen emission reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's best Available Emissions Reduction (BAER)

This is an imperative first step in our health and survival. Thank you, Mary Wall

I am opposed to any and all rules that would not protect our environment. I oppose rules that would allow gas utilities to use out of state bio methane investments. I oppose any expansion of industrial emitters. I oppose unchecked climate pollution in Oregon. Come on people, WHAT THE HECK, why is it even a conversation. You know what the right thing to do is. Quit acting like we can go on like this. We must change or die. Please choose to protect our environment. Please.

Sincerely,  
Julie Sonam

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.
