## Climate 2023 Proposed Rulemaking

This document is a compilation of written comments (e-mail and USPS mail) received during the public comment period for the Climate 2023 Notice of Proposed Rulemaking. The comment period opened August 22, 2023. In response to a request for extension of comment period under ORS 183.335(4), DEQ extended the original comment period by 21 days in order to allow further opportunity to submit comment on the proposed rule amendments until 4 p.m. on Oct. 13, 2023. Only comments received before the deadline are included in this document.

Sounds good.

I'm for the changes, only if the new rules lead to cleaner air and slow climate change.

- As long as they are rigorously monitored and enforced.
- Not like the Port of Morrow fiasco.
- No proposed fines ultimately negotiated down to meaningless in service to “educating” offenders to get their cooperation.
- Public, widespread disclosure of fine appeal settlements.
- Environmental Justice: Such settlements must correct the offending actions where they occur, no far off mitigation benefiting privileged communities.
- No cronyism with influential businesses.
- Rules must have teeth so those regulated know you mean business.

Weak enforcement is unfair to competitors who obey the rules.

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Sincerely,  
Taylor Vos

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions

will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

Dear Oregon Department of Environmental Quality,

The evidence is clear: we only have a limited time to act and cut greenhouse gas emissions in order to prevent irreversible and catastrophic climate impacts. Unfortunately, Oregon has not done enough to achieve the necessary emissions reductions to meet critical climate goals. We are currently 19% short of our 2020 target, and our existing policies are inadequate to meet President Biden's commitment to cut U.S. emissions by 50% from 2005 levels by 2030. Without additional measures, lives and livelihoods will be at risk.

We need to increase our ambition and seize every opportunity to strengthen Oregon's climate programs. The Climate Protection Program (CPP) is crucial in holding polluters accountable, becoming only the third program in the nation to establish an enforceable, declining cap on emissions from transportation and natural gas use. It is vital that we do not allow any weakening of the CPP.

I am concerned that the draft rules proposed by the Department of Environmental Quality (DEQ) will weaken the Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must ensure the following:

1. Climate, economic, and public health benefits for Oregonians: DEQ's draft rules determine how biomethane and hydrogen can be used for CPP compliance. I urge DEQ to restrict the use of biomethane for compliance to projects that directly benefit Oregonians, rather than allowing natural gas companies to rely on out-of-state investments. In order to achieve the necessary benefits, it is essential that we focus on cutting pollution within our own state. Additionally, the full environmental impacts of biomethane and hydrogen fuels must be accounted for in CPP compliance obligations. We must consider the risks and potential warming effect of hydrogen leakage, as well as accurately reflect the climate impacts of biogas based on its source and injection methods.
2. Industrial sources of emissions: All large industrial emitters must be held accountable for their greenhouse gas emissions. It is crucial that DEQ ensures comprehensive coverage of climate pollution. Any new stationary source or proposed modification with the potential for greenhouse gas emissions should be required to complete a best available emissions reductions (BAER) assessment. These assessments must be transparent and allow for meaningful public review and input. Moreover, the BAER assessments must translate into concrete emission reduction requirements aligned with science-based goals. Currently, industrial emissions are exempted from binding reduction requirements consistent with the CPP's declining emissions cap. These industrial sources account for approximately 20% of Oregon's total emissions, and projections indicate that their emissions will continue to rise. It is unacceptable that emissions from these sources could increase under the CPP, endangering Oregon's climate future. DEQ must ensure that industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking process will have significant implications for Oregon's ability to reduce

climate pollution and hold polluters accountable. It is crucial that the final rules deliver a stronger Climate Protection Program that prioritizes the well-being of Oregon's families and communities.

It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Oregon owes a lot of its strengths to rail infrastructure, much of which unfortunately no longer even exists (including the Oregon Electric and Red Electric Interurban Passenger Railways, an elaborate and extensive streetcar grid they interfaced with as well as an integrated bunch of trolley lines.) The turncoat auto industry lobbied to have our taxpayer dollars funded passenger interurban and municipal routes torn out and paved over or else neglected into failure after privatization in acts of premeditated sabotage and treachery; this is before they further betrayed the nation by moving manufacturing out of country decimating the American workforce to only be rewarded for this sedition by being subsidized by our taxes along with being bailed out multiple times only for the executives to pocket the money we were taxed for their personal profits of plunder and pilfering pillage. The further we move away from the logical layout provided by streetcar grids and electric commuter interurban railroads the uglier and less livable the city and its suburbs become. An intelligent coastal city would take advantage of this limited time of people crowding in to install city assets that will benefit us for generations such as a rail route beneath the Willamette meaning the Steel Bridge won't break the light rail circuit interrupting all MAX lines every time it lifts, and railway going between Vancouver and Portland when the new bridge is finally finished. I-5 should be buried on the inner east side stretch to make the area tolerable and reclaim space for the Black community to rebuild their community they had stolen from them. The WES should expand to extend down to Salem reuniting the Portland metropolitan area with our capital. It makes perfect sense to build the full Southwest Corridor (Purple) Line with railway stations on Marquam Hill and at Portland Community College Sylvania Campus, for example, and zero sense not to.

Electric cars also destroy the environment through resource mining, manufacturing processes and ultimately going to the landfill in mass droves. The pollution they cause is simply unnecessary as is the amount of urban space squandered on parking and other paved over autocentric wastes. MORE VEHICLES ON THE ROAD MEANS MORE AVOIDABLE DEATHS WILL CONTINUE TO CONSTANTLY OCCUR! They also perpetuate redlining, urban sprawl, the food deserts that come from that invariably, along with cities that are not navigable as a pedestrian or bicyclist and are, in fact, inhospitable to humanity along with being lethally horrendous towards animals. They add to traffic congestion. Commodification of societal needs and normalization of trying to substitute rampant consumerism where we need standardized, regulated and uniform public utilities doesn't work.

Putting the financial burden of transportation inefficiently and directly on the individual citizen is simply not wise or fair and hasn't been the norm for even 80 years. We need to invest in commuter rail that's properly implemented as it typically is overseas. A commuter rail system is an engineering marvel while buses are just buses. The most reliable predictor of a neighborhood being impoverished is if it has no commuter rail connection. The American people are apathetic through decades of disenfranchisement and a lot of that marginalization (eg Robert Moses's racist urban renewal) is through divestment of public infrastructure, utilities and programs to help the American people. We can't undo the social inequities

inflicted upon and retained by redlining until we transcend the highway robbery carcentric built habitat that physically structurally reinforces them. We're past the point of car dominated transportation being anything better than a tragic hindrance or an outright travesty. Public works materially improving life for the taxpaying citizenry will bolster civic pride.

Transcontinental High Speed Rail should integrate seamlessly with commuter rail networks so it can evenly function as one cohesive system and this will convert flyover country (CONUS flights should be virtually eliminated) back into a thriving heartland by functioning as an artery of commute and commerce which will reduce clustering on the coasts. Similarly, wholly integrated circuits of commuter rail blended with interurban routes, light rail lines, street car grids, subways, and even trolleys along with electric ferries functioning together as a comprehensive, coherent series of interwoven systems would prevent people from having to live on top of each other in city centers in order to have quick access to urban cores and downtown areas so this would stimulate our local economies and prevent gentrification from demolishing cherished heirlooms of our historicity, destroying our classic neighborhoods, shredding the fabric of our communities and toppling our civic landmarks and architectural heirlooms along with other social capital such as venerable culture generating venues. We lost so many marvelous structures for nothing more than mere surface lots as our city was hollowed out on the heels of white flight to the lily white, poorly planned suburbs. Whole swaths of communities were obliterated in a racist/classist attack on the people of Portland and we lost entire neighborhoods along with cultural centers such as the Jazz District, our Italian and Jewish neighborhoods as well as other minorities who weren't even assisted with any sort of fair, decent assistance to relocate. The absolute annihilation of our city still adversely hinders us collectively to this hamstrung day, and the groups targeted, intensely even if so many folks don't know enough to connect the dots of cause and effect.

Numerous studies show that built environments of homogenously bleak and bland duplitecture dreck that profiteering developers push on us for their privatized gains to our public loss for the riches of themselves and corporate slumlords not only cause homelessness from being financially inaccessible to most Americans, but also cause depression from creating such a devastatingly sterile, cold, unloving urban habitat that's too congested and overcrowded to work properly as a correctly engineered built environment. Our roadways are overcrowded and no amount of widening them and adding lanes will do anything to help it because it just leads to induced demand that inevitably grinds to a halt at snags and bottlenecks down the road. Shouldn't American cities be thriving centers of culture and character rather than austere and chintzy morasses of mediocrity?

I believe that we can design the cities of our nation to reflect a future that embraces humanity and that we also must for America to have any sort of a bright future ahead of it. Right now we are mired in the destruction of our cities from the inward attacking neocolonial oppressors who weaponize their clout of wealth against the nation for their own off-shore un-American gains of privileged, parasitic, private profits. This greed fueled anti-social exploitation is present day feudalism driving us into another gilded age. Tons of new petrochemical building "luxury living" housing units remain empty serving only as financial assets in investment portfolios of hedge fund, "private equity" and permanent capital firm cretins sheltering dubiously acquired wealth instead of as direly needed shelter for humans. We deserve a landscape we can be proud of and country should come first before corporate looting and exploitation. Legacies are important and live on forever.

With space opened up in our cities we could rebuild beloved structures now gone missing

from economic and environmental disaster utilizing new technologies such as hempcrete and 3-D printing. We could create vertical agriculture, green pocket areas, etc. on spots currently now just serving as paved over squares and nothing more. 20% of Portland is parking lots and paved over area not even suitable for that inefficient usage. We can extend democracy into offering the taxpayer residents democratic say in what their city consists of, how it looks and how it operates promoting civic engagement and participation.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

If the environment is not protected in Oregon then where? I have lived here all my life. Spent every day in our nearby national parks. To see our environment go to waste would be a shame. We feel the heat and have not forgotten what the snow used to be. We know our power will be massively effected through climate change. Current generations must suffer through the consequences of our past environmental decisions. There will be no future if we forget the impact of the present.

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Hello, I am an aspiring scientist soon to graduate with my B.S. in physics at U of O. I've lived in Oregon my entire life and the one thing I've always been proud of is how much better than most of the advanced world we are at caring for our environment. But we need to be vigilant. Anyone with any sort of power needs to be doing everything they can to put the nail in fossil fuel companies' coffin. So please, do the right thing. Strengthen green policies, and continue using science to inform decisions.

It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden. You have allowed the destruction of Oregon's Mid Coast watershed and are incentivized by the ton to increase allowable discharge. Georgia Pacific Mill and Juno is washing garbage with our drinking water supply while under a Declared State of Emergency for Drought by Lincoln County Commissioners yet Georgia Pacific will go around the rules and purchase city water at \$4.50 per 1000 gallons while I pay that for one bottle of Fugi water. You all should lose your positions and the records will support every word.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION**

IN LINE WITH THE CPP'S DECLINING CAP. All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

I am concerned to hear that the Rule making Advisory Committee that was establish to further the Climate Protection Program was so heavily composed and influenced by members of the energy industry, with minimal input from environmental groups. And, as would be expected, the resulting rules fall far short on what is required to protect our environment. In particular, the term " best available emissions reduction technology" seems to leave the "Barn Door Open" for allowing corporation to be excused from any serious attempt at methane or carbon dioxide reduction. Please address the short comings of the Advisory committee.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Hello,

I am writing as a concerned Oregon citizen. DEQ's current proposed Climate rules do not effectively align with the CPP, Oregon's cornerstone Climate Protection Program.

This program is essential to achieving our state's climate pollution reduction goals. As you recall, it was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process.

My requests, as a citizen of Oregon and this mother Earth

DEQ should amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Respectfully,  
Kara Chanasyk

Hello,

Please amend the rules to disallow out of state investments to qualify as emission reduction credits. All emission reductions or credits should be from in-state investments only.

Thank you

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Please strengthen, not weaken the Climate Protection Program (CPP). The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent,

with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

Please amend the rules such that fossil fuel emitters in Oregon do not have carbon offsets located in places other than Oregon as an "out".

Three reasons the rules pertaining to this work against Oregonians and a more sustainable future:

1. This will remove money from the state-wide climate fund and job opportunities for Oregonians to help move our state to a greener energy future;
2. continuing to allow fossil fuel emitters to emit in perpetuity will slow the transition of other parts of our current carbon-intensive system, such as home heating and cooking;
3. carbon offsets can often be of dubious quality and longevity and they are out of Oregon state's ability to guarantee or influence if they are outside our boundaries.

The options before you are whether we want our move to a greener future to work best for Oregonians or work best for companies that don't have any particular love for our state, just making money in it. I hope you'll move to support the version of the rules that supports cleaner air, better environmental behavior, and new job opportunities right here at home instead of allowing fossil fuel companies to kick the can down the road on making a shift that is a long time coming.

Thank you for your time and consideration.

Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

To whom it may concern,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic

development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

After a long DEQ process with much public engagement to develop a climate action program, I urge you to stay the course and ensure that the Oregon Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities.

Given the many climate crises manifestations just this year alone (2023), it is NOT the moment to weaken standards

Specifically, it is vital that DEQ strengthen its [current proposed rules](#) by:

1. Restricting biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

**We count on the DEQ to fulfill its mandate to deliver for Oregon to achieve our climate action goals!**

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

You don't often get email from [thorhinckley53@gmail.com](mailto:thorhinckley53@gmail.com). [Learn why this is important](#)

Dear Chair George, Vice Chair Baraso, members of the Commission; and DEQ staff,

My name is Thor Hinckley, in addition to being the Transportation Electrification Consultant for Solar Energy Trade Shows Inc., I also serve as a member of the Oregon Third Act Steering Committee, Portland First Unitarian Church's Center for Earth Committee and the Metro Climate Action Team. In my professional career, I formerly served as Manager of PGE's Renewable Power Program, which is still ranked 1st in the nation for total number of customers.

I want to thank you for the opportunity to provide comments today on DEQ's 2023 climate rulemaking. As DEQ staff knows, this rulemaking will have major consequences for the climate and the communities in Oregon going forward.

By including guardrails and pathways for regulated entities to comply with Oregon's Climate Protection Program, this program will be vital to ensuring our state stays on track to achieve important climate goals, and deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, with the broad scope of issues and laws touched by this proceeding, there could very well be some unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am very concerned that DEQ's current proposed rules would effectively undermine the CPP, a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive rulemaking and stakeholder engagement process.

I am very concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

This would undermine the integrity of the CPP, and the current proposed rule amendments will severely compromise the program's public health, economic, and employment goals, as well as hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians in Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

In addition, I strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Thor Hinckley

You don't often get email from joseph.stenger@gmail.com. [Learn why this is important](#)

Dear EQC Chair George, Vice Chair Baraso, members of the Commission and DEQ staff:

My name is Joseph Stenger. I am a resident of NE Portland, a grandfather, a family physician, and a citizen with huge concerns about the rapidly increasing calamities due to the deterioration of our climate.

Thank you for the chance to give comments today on DEQ's 2023 climate rulemaking. This rulemaking will affect the future for our children and grandchildren and beyond. It is crucial to get this right, based on the well-known rising level of threat. Every governmental entity should be prioritizing a rapid transition to a clean-energy economy.

This rulemaking is the time to be sure that Oregon is on track to meet the climate targets set out by the Global Warming Commission. Ensuring that regulated entities comply with our Climate Protection Program (CPP) will provide huge cost-saving benefits to public health and create clean jobs and economic vitality. These benefits should be specifically most targeted to communities that historically have suffered the worst environmental damage, such as the Cully neighborhood near where I live. Given the broad scope of issues and laws affected by this rulemaking, there will be deep consequences if the rules do not seriously address impacts to these communities and the climate.

Large corporations that have amassed huge wealth from the sale of dangerous fossil-fuels, while suppressing information about those dangers, must be held to account for their role in converting to a clean-energy future. They should no longer be given allowances that will delay that conversion. Any new stationary source or any proposed modification that has the potential to emit GHGs in any quantity should complete a BAER assessment prior to construction.

DEQ's current proposed rules could undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution

reduction goals, a program that was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. There already is significant leeway in compliance to protect utilities.

Specifically, I am concerned that the current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

I ask you to amend the proposed rules as follows:

- 1) Restrict biomethane (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians; and
- 2) Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP. I strongly support maintaining protective restrictions on biomethane accounting to that effect in the current rules where they already exist. We also do not want to allow investments to be diverted from the Community Climate Investment (CCI) program.

Doing this will help ensure that Oregon stays on track to achieve our climate goals, and will maximize the resulting job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, rather than those out-of-state.

I appreciate the opportunity to provide comments. I trust that you will make the best choices for all present and future Oregonians.

Joseph Stenger MD

Dear Commissioners,

The New DEQ program purports to reduce greenhouse gas emissions in Oregon by 90% by 2050. The Oregon Environmental Quality Commission voted 3-1 to establish the Climate Protection Program which sets enforceable limits on greenhouse gas emissions from fossil fuels used throughout Oregon.

An admirable program were it actually able to deliver on its promises.

What is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon can lead or it can follow a path of least resistance as its current program is inadequate to meet the stated goals. DEQ has not done enough to lock in the pollution reductions that science knows are needed to achieve these critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030.

Without additional policies and programs in place to slash these dangerous pollutants including greenhouse gas emissions, Oregon will continue to fall short – putting our lives and future generations at increased risk of defaulting with their lives.

We need to increase our climate ambition, and we can't afford to miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) is only the third regulation of its kind in the nation to place an enforceable, declining cap on climate-harming pollution from transportation and natural gas usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

Sincerely,  
Randy Knop

This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
Kristina DiTullo

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Environmental Quality Commission and DEQ staff,

I appreciate the opportunity to provide comment today on DEQ's 2023 climate rulemaking. As you well know, the specifics of these rules will have far-reaching consequences for the climate, and for the health and well-being of communities throughout Oregon.

As a resident of Tillamook county who is concerned both about the worsening extreme weather, flooding, and fires induced by climate change, and about public health and environmental justice, I am concerned that the [current proposed rules](#) undermine the goals of the Climate Protection Program and would have damaging unintended consequences for communities across Oregon.

I therefore strongly urge DEQ to amend the proposed rules by:

**1) Eliminating the option to use out of state biomethane or hydrogen for CPP compliance.** Biomethane and hydrogen are themselves problematic because of leakage, NOx pollution when combusted, and pollution from production, and if used at all should be vetted carefully for direct benefits for Oregonians. Reliance on out-of-state biomethane would likely have the additional adverse effect of investments being diverted from the Community Climate Investment (CCI) program.

**2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.** The CPP is the only existing state regulation on major industrial emitters. Therefore it is vital that its rules create both public health and equity improvements, and actual emissions reductions from existing stationary sources. New stationary sources of pollution should be deterred.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP.

These amendments and safeguards will help ensure that Oregon stays on track to achieve our climate goals, at the same time as stimulating job creation, cost saving, public health, and economic development benefits. Let's ensure the new rules benefit Oregon communities.

Thank you for considering my comments.

Jeffrey Weitzel

BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

- Good evening, I'd like to submit testimony on DEQ's 2023 climate rulemaking.
- I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.
- Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.
- By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.
- I therefore strongly urge DEQ to amend the proposed rules by:
  - 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians; and
  - 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.
  - I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP.
  -

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

◦

Thank you for the opportunity to provide comments.

- Valeria McWilliams

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Climate change and devastation is here. We see it around the world and in Oregon - affecting farmers, ranchers, fishing industry folks, and every day people. It is critical that Oregon do what it can to reduce carbon emissions. My faith demands that I work to protect all living things.

The Climate Protection Program is to provide benefits to local communities. Please adopt rules that maximize benefits to Oregonians. Specifically, it is vital that DEQ strengthen its current proposed rules by 1) Restricting biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians. and 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Thank you.

Hi,

I'm a long-time Oregon resident and a member of Climate Reality PDX. I am writing to encourage stronger support of the Climate Protection Program (CPP) by modifying the current proposed climate rules to restrict biomethane used for CPP compliance to that which provides direct benefits for Oregonians and to strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program. The CPP already provides gas utilities with significant flexibility and cost constraints to comply, and increasing emissions from industrial sites threaten Oregon's ability to meet its climate goals. These modifications in the proposed rules will help keep the state's emission reductions on track and maximize public health and economic benefits for Oregonians.

Thank you.

Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. Chair George, Vice-Chair Baraso, DEQ staff and members of the Commission  
I am Bill Harris. I am an active member of several citizen groups seeking climate solutions. The DEQ effort and actions over many months encouraged me as I watched, and occasionally contributed testimony to development of the TPP program. This program can be a major portion of the Oregon actions that cause reduction in OUR SHARE of GHG and in a manner which invests in reversing climate change problems in impacted communities. The program gives fuel suppliers who choose not to meet their assigned limit of distribution the opportunity to make Community Climate Investments. CCI's invest in weatherization, installation of electric heating, promotion of electric vehicles and charging systems and carbon storage. Thereby diminishing the release of GHG, having healthier homes and the employment essential to these changes. The proposal to to permit CPP compliance by so called green natural gas(biomethane) inherently produces GHG and it diverts money from CCI reduction of GHG and from employment through the CCI program. The benefits from our program should be within Oregon. During the many months development of rules it was clearly difficult to design a program which would control GHG release from large stationary users. The REIT program was chosen as the best arrangement. This program needs to be firmly enforced. The TPP is an excellent program. Please do not change it in ways that diminish our limitations on GHG production or on support to impacted communities. I am grateful for the opportunity to make these comments.

Bill Harris

- Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.
- Thank you for the opportunity to provide comments.

Dear Commissioners,

I have been a climate activist for over 15 years. I am tired of the slow acknowledgement and progress we have made. We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
John Livingston

Dear Commissioners,

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I want my grandchildren to be able to have a quality life!

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
bruce bauer

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Commissioners,

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. To: Environmental Quality Commission  
From: Jeanne Roy, 6805 SW 12<sup>th</sup> Ave., Portland, R 97219  
Date: September 12, 2023  
Subject: 2023 Climate Rulemaking Comments

I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments and would enable the expansion of new large industrial emitters with the potential to emit unrestrained climate pollution in Oregon. I therefore urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits, ensuring that they benefit Oregon communities and are not exported out of state.

Good morning, DEQ team,

I wonder if one of you could respond to this hypothetical and answer this question for me.

Grey hydrogen is produced in Texas with fossil gas. A nongovernmental agency is formed to create certificates associated with the production of the hydrogen. The hydrogen is injected into a pipe in Texas. Theoretically, that pipeline connects to Oregon. A gas utility in Oregon purchases the certificate and records it through a book and claim system. The "use of the fuel" results in lower GHG emissions. That is denoted on the certificate. **Can a gas utility use that certificate to demonstrate emissions reductions for purposes of compliance with the Climate Protection Program? Is DEQ proposing to independently determine an emissions reduction from the environmental attributes noted in the certificate? If so, how and where is that defined in the rules?**

Thanks so much for any guidance you can offer.

Warmly,  
Carra

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Greetings DEQ Administration

One one level I'm surprised at the fact that 12 of the 14 advisory members are from the Oil and Gas sector. After all, this program is intended to protect the 4 million people that reside in Oregon.

What we need is to have less GHG emissions.

We need reliable means to measure Air pollution including PPE

We need strong compliance monitoring and reporting and it should be implemented by Q4 2025.

We need the industry and your agency to place value on the health of the public and of animals, plants, rivers and wetlands.

We need more equal representation on Rule Making Committee

We all know from past behavior that the industry will capitalize on every loophole; notably RTC ;NO NO NO to RTC ! Delete it from the options.

Thank you

CC Governor Kotek

Chair George, Vice Chair Baraso, members of the Commission:

My name is Melissa Medeiros and I am a volunteer with Families for Climate. I am a parent to my daughter, a 5th grader, I am writing this testimony because as their parent, my most fundamental responsibility is to protect them from harm, and irreversible climate change gravely threatens their future.

**The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science.** However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

1. **Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.
2. **Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

[You don't often get email from kb@travelinglantern.com. Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Chair George, Vice Chair Baraso, and members of the Commission, DEQ and DEQ staff;

My name is KB Mercer and I am a volunteer with the Metro Climate Action Team. My husband David and I are deeply concerned about DEQ's 2023 climate rulemaking.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Dear Commissioners,

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
Diana Bailey  
PO Box 2142  
Roseburg, OR 97470

**From:** [Karen Jacobson](#)

**Subject:** 2023 Climate rulemaking for the Climate Protection Program- keep it strong and green!  
**Date:** Tuesday, September 12, 2023 2:04:57 PM

---

You don't often get email from [kajacobson@gmail.com](mailto:kajacobson@gmail.com). [Learn why this is important](#)

Chair George, Vice Chair Baraso, members of the Commission:

My name is Karen Jacobson and I am a volunteer with Families for Climate. I am a mother to 2 bright, strong daughters named Alaina and Juliet who attend elementary school in Portland, Oregon. I am writing this testimony because as their mother, my most fundamental responsibility is to protect them from harm, and irreversible climate change gravely threatens their future.

I am deeply concerned that the current proposed rules would undermine the effectiveness of the Climate Protection Program.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

1. **Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.
2. **Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution. For example, companies as large as Amazon do not need polluting exemptions to build or expand operations at data centers in Eastern Oregon.

Thank you for the opportunity. I'm sure, like me, you have loved ones both young and old who love Oregon and want our beautiful state to be protected. Let's work together to protect Oregon from outside polluters.

Karen Jacobson

**From:** [Emily Stebbins](#)

Chair George, Vice Chair Baraso, and members of the Commission:

My name is Emily Stebbins, and I am a parent and educator in Portland.

Climate chaos poses an imminent threat, as well as a grave threat to the future of our children. The Climate Protection Program is critical for Oregon to reduce our climate pollution on the urgent timeline necessary.

However, I am deeply concerned that the current proposed rules would undermine its effectiveness. DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I urge DEQ to make the following key changes:

1. **Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** Natural gas poses a direct health threat in our homes and workplaces, as well as in our broader community and global climate. Out-of-state offsets will not accomplish the CPP's stated goals of reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers.
2. **Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Emily Stebbins

---

You don't often get email from [renebragacampa@gmail.com](mailto:renebragacampa@gmail.com). [Learn why this is important](#)

Thank you for the opportunity to provide comment today on DEQ's 2023 climate rulemaking, as DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP—a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

- I therefore strongly urge DEQ to amend the proposed rules by:
  - 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
  - 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program. The CPP already provides significant flexibility/cost constraints for gas utilities to comply. Allowing further flexibility—e.g. use of RTCs—will hinder the transition to non-emitting alternatives and fail to reduce climate/air pollution or deliver health/consumer benefits for environmental justice communities in Oregon. These projects deliver no direct benefits to Oregonians, while CCI's will provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.
- 

As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon.

- Any new stationary source or any proposed modification that has the potential to emit GHGs in any quantity should complete a BAER assessment prior to construction.
- As-is, the BAER approach for regulating large stationary sources will not effectively reduce sector-wide emissions.
- As one example, Amazon is seeking multiple permits to build or expand operations at several energy-intensive, fossil gas-powered data centers in Eastern Oregon; these data centers alone will result in an enormous increase in gas use and GHG

emissions.

- Further, in the 2023 legislative session, lawmakers adopted the “Oregon CHIPS Act,” which provides \$210 million in funding and creates land use exemptions to accelerate the development of semiconductor plants or other advanced manufacturing facilities.
- Given the increasing inevitability of a growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program.

Thank you

**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Tuesday, September 12, 2023 4:34:56 PM

---

You don't often get email from [ksjc1988@grsdelivery.com](mailto:ksjc1988@grsdelivery.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

**Subject:** 2023 Climate Rulemaking  
**Date:** Tuesday, September 12, 2023 10:50:00 PM

---

You don't often get email from [sww02755@gmail.com](mailto:sww02755@gmail.com). [Learn why this is important](#)

To Chair George, Vice Chair Baraso, and Members of the Commission:

My name is Susan Weinstein and I live in Fairview, Oregon. I am the grandmother of Miguel, 16; Nico, 12; and Ellie, 5.

They, like all children, need to be kept safe and protected from danger. Irreversible climate change threatens their future.

The Climate Protection Program (CPP) is absolutely critical for Oregon and for providing the opportunity for our children and grandchildren to have safe and healthy lives.

We need to reduce our climate pollution on the urgent timetable dictated by current science.

The rules currently proposed would, I fear, undermine the effectiveness of the Climate Protection Plan. The necessary emissions reductions would be put out of reach of achievement.

I think that the DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets which hinder the transition to non-emitting alternatives; and, fail to deliver direct benefits to Oregonians.

Also, I am worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

Respectfully, I ask the DEQ to make the following important changes to the rulemaking:

1. Restrict biomethane (aka renewable natural gas (RNG)) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians. Out-of-state offsets do not achieve the CPP goals of reducing gas emissions and other air pollutants; do not maximize public health benefits; and, do not minimize costs for consumers.

2. Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under CPP's Best Available Emissions Reduction (BAER) program. With Oregon's growing industrial sector, it is critical that DEQ use this rulemaking to strengthen the integrity of the BAER program.

Please strengthen these rules so that they can protect the future of all of our children and grandchildren.

Thank you for the opportunity to comment on the rulemaking.

Susan Weinstein

BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

As an life long Oregonian I have come to rely on our strong environmental laws here and enjoy the benefits of cleaner air quality then other states with less regulatory oversight. Recently, due to so many wildfires the air quality has been pretty bad. That is why I am so surprised to hear the DEQ is reducing these regulations for large industrial emitters. Everyone has to do their part for clean air from someone like me to huge corporations like Amazon. I strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

To those involved - each summer large parts of Oregon and the West are blanketed in smoke. This is dangerous to all living things by contaminating the air needed for respiration and greatly reduces the amount of sunshine needed for growth and life. Despite this huge amount of carbon-based pollution Oregon still allows field burning! Some days this adds to existing smoke and on other clear days it totally covers and fouls the air with these HUGE clouds of smoke choking life and blocking the sun. Please stop this ridiculous field burning. The Oregon ag industry is huge and powerful, filled with intelligent people. Apparently they need to be forced to develop ag methods that are safe for all life and not just what is best and most expedient for their profits. Please take action to end this practice. Thank you. Joe and Pam Craig, Silverton OR.

The Oregon Department of Environmental Quality (DEQ) must ensure the Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities.

I am writing to strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP’s Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Hello Chair George, Vice Chair Baraso, members of the Commission,

- Thank you for the opportunity to provide comment today on DEQ's 2023 climate rulemaking.
- As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.
- By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.
- However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.
- I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.
- Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.
- By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

- I therefore strongly urge DEQ to amend the proposed rules by:
  - 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
  - 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP’s Best Available Emissions Reduction program.
  
- I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP.
  
- Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.
  
- Thank you for the opportunity to provide comments.

Sincerely,

Sigrid Kellenter Girdner

Dear DEQ,

Please help save our planet for everyone including all our future generations. Look at how the climate change has affected us already just think what it will be like in 10 years if we don't do something now. Think of your kids and grandkids do you want them to be able to enjoy all that nature has to offer? Where we live we weren't able to enjoy almost a whole month of summer due to wildfire smoke and having to stay indoors. That is not how I want to live. When I was growing up in Oregon we might have one or two wildfires a summer and they were contained fairly quickly. If you want to see how many fires there are now just get the app Watch Duty and take a look. It is really sad to see all the beautiful forest going up in smoke and all the wildlife that is being destroyed. Then take a look around the world at all the climate disasters going on with hurricane, floods, tornados and fires. Look at what is happening to all the areas with permafrost that are thawing due to warming climates and all the methane that is being put into our atmosphere causing even more climate warming.

Please help our planet to survive for all to enjoy now and into the future.

Darlene Knox

Dear all,

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

- Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.
- By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.
- I therefore strongly urge DEQ to amend the proposed rules by:
  - 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
  - 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.
- I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP.
- Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Given the increasing inevitability of a growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program.

Thanks for your attention to these pressing matters,

Heather Dale

To: Members of the Oregon Environmental Quality Commission:

Thank you for this opportunity to provide comments on DEQ's rulemaking process for Oregon's Climate Protection Program (CPP) .

DEQ's proposed rules will effectively undermine the CPP. They will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

Specifically, I am concerned that the current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unregulated climate pollution in Oregon.

I therefore strongly urge DEQ to amend the proposed rules as follows:

- 1) Restrict biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen which is injected into a pipeline within Oregon
- 2) Strengthen emission reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits. It will also ensure that the CPP will benefit Oregon communities, not out of state entities.

Walt Mintkeski  
Portland,OR

Please strengthen the current proposed rules. Restrict the use of biomethane natural gas and hydrogen to only that whichever directly benefits Oregonians. And strengthen emissions reductions requirements for new facilities.

Our beautiful state is counting on you.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Chair George, Vice Chair Baraso, members of the Commission:

My name is Max Scher, and I am a volunteer with Families for Climate. I am a father to two little girls, Clarabel & Felicity. I am writing this testimony because as their parent, my most fundamental responsibility is to protect them from harm, and irreversible climate change gravely threatens their future.

The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science. However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

1. **Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals. These projects deliver no direct benefits to Oregonians, while CCIs will provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions. The CCI program was developed and informed by many months of engagement with environmental justice communities in Oregon, with the goal of supporting investments that maximize public health, jobs, and cost-saving benefits for these and other communities historically disenfranchised and disproportionately impacted by economic disinvestment, health challenges, and environmental harms.
2. **Strengthen emissions reduction requirements for new or expanded large**

**stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality. Continuing to enable the development of new sources or expansion of existing sources flies in the face of the CPP's stated equity and climate goals. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Sincerely,  
Max Scher

Hi there,

Thank you I'm advance for taking the time to read my message.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

Kindly,  
Drew

Good afternoon!

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the

current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

To the DEQ,  
Bottom line = Please strengthen the proposed 2023 climate rules.

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and

- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

I totally agree with the statements below.

The Oregon Department of Environmental Quality (DEQ) must ensure the Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities. Specifically, it is vital that the DEQ *strengthen* its [current proposed rules](#) by:

1. Restricting biomethane (aka renewable natural gas (RNG)) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Dear DEQ,

As a physician, public health advocate, and mother, I am compelled to comment on DEQ's 2023 climate rule-making since it will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, and blatant industry influence on considerations around the rule-making, there could be very serious consequences if impacts to communities and the climate are not sufficiently considered.

I am upset that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am unhappy that current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon.
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions

Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you,  
Jenny Pompilio MD, MPH

## Oregonians want the CPP to focus on the original goals of:

- **reducing greenhouse gas emissions** and other air pollutants, **maximizing public health** benefits, and **minimizing costs** for consumers in environmental justice and other communities in Oregon.
- keeping economic and health benefits of the Community Climate Investment program in Oregon: **investments should materially benefit Oregonians** rather than paying for cheap offsets in other places.
- **real reduction of emissions** by 50%, rather than allowing companies to invest in “renewable natural gas” (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- **holding big polluters accountable** to engage in science-based “best available emissions reductions” (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.

Thank you for your work.

Sincerely

Dana Mozer

Department of Environmental Quality

To get right to the point, we are on the verge of climate collapse. I have 2 precious little grandchildren who deserve a future, as do all of our children. Please do not undermine the integrity of the CPP. I ask you to amend the proposed rules by

- 1) Restricting bio methane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only bio methane or hydrogen that is injected into a pipeline within Oregon; &
- 2) strengthening emissions, reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP’s Best Available Emissions Reduction program.

Thank you for considering the needs and best interests of Oregonians over the profits of the oil and gas industries.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

I appreciate DEQ's action on climate. When I have contacted DEQ with questions, you have been very helpful. Thank you.

The 2023 Climate rules are definitely a step in the right direction. I urge you to go further towards meeting the Climate Protection Program (CPP) goals requiring 50% emissions reductions in Oregon's largest polluting facilities by 2035, providing direct economic and environmental benefits to frontline communities, and more.

Specifically, meeting the original CPP goals of:

- **reducing greenhouse gas emissions** and other air pollutants, **maximizing public health** benefits, and **minimizing costs** for consumers in environmental justice and other communities in Oregon.
- keeping economic and health benefits of the Community Climate Investment program in Oregon: **investments should materially benefit Oregonians** rather than paying for cheap offsets in other places.
- **real reduction of emissions** by 50%, rather than allowing companies to invest in “renewable natural gas” (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- **holding big polluters accountable** to engage in science-based “best available emissions reductions” (BAER) from existing stationary sources and blocking development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.

Thank you,  
Katherine

DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Derek Gendvil

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

There is nothing more important than accelerating the reduction of pollution in our environment. Scientists are increasingly sounding major alarms. We need to sacrifice now to protect the future of our children.

The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Kara Perry

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Chris Smith

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

As a long-time advocate for action to prevent dangerous climate change, I strongly support the Climate Protection Program (CPP), which is absolutely essential to achieving our state's climate pollution reduction goals. Moreover, it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP by allowing regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to ensure that Oregon stays on track to achieve our climate goals, to maximize the associated job creation, cost saving, public health, and economic development benefits from the rules, and to ensure that benefits flow to Oregon communities first, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

I implore you to reject DEQ's proposed rules that would cripple the Climate Protection Program. You knew when you adopted the CPP that industrial polluters would scream and cry but please remember the overwhelming public support it garnered. Oregonians recognize the need for bold actions in the form of strong regulations. Please demonstrate a sense of urgency in your work to address the dangers of climate change.

Please demonstrate the requisite leadership and direct DEQ to amend the proposed rules and to ensure that Oregon can make significant real progress in achieving our climate goals.

Thank you.

Sincerely,  
Joseph Youren

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. I reiterate, " These emissions reductions can provide significant economic benefits by encouraging technological innovation and investments in clean energy, which will support job creation." Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state. In conclusion, I say again, " These emissions reductions can provide significant economic benefits by encouraging technological innovation and investments in clean energy, which will support job creation."

Thank you.

Sincerely,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,

Dear Oregon Department of Environmental Quality,

Climate change is the leading issue of the day. Ignoring scientific warnings, humans have continued to pollute the Earth. Now any government attempt to improve the situation is fought against by the very people who caused the problem. Oregon is one of the greenest states in the nation and this new rulemaking helps our forests, our economy and our health.

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
John Duggan

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

I urge the DEQ in the strongest possible way to keep Oregon's CPP on track to deliver its stated climate goals and associated benefits for public health, employment, environmental justice, and the economy.

We absolutely **MUST** achieve the state's climate pollution reduction goals, and the CPP is our tool to do that. It was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process, and should not be derailed by the repeated and heavily-funded complaints of polluters. **WE ARE FAR PAST THE TIME TO MAKE CONCESSIONS TO PROFITEERS WHILE OUR FUTURE AND THAT OF OUR DEPENDENTS CRUMBLE UNDER CLIMATE CHANGE.**

DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. This of course undermines the CPP. **CAN NOT DO. THE PULIC SAYS NO. WE ARE SUFFERING. WE ARE IN CRISIS. WE NEED YOU TO PUT IN PLACE GUARDRAILS FOR REGULATED ENTITIES TO COMPLY WITH OREGON'S CPP.**

I strongly urge DEQ to keep a strong CPP for the benefit of the people of Oregon, not weaken it for the \$\$\$ benefit of the few.

Thank you.

Dear Oregon Department of Environmental Quality,

I am concerned that management and adherence to CPP will fall under the un-public management by administrative rule which is hidden from the public and fraught with potential for mischief. Amendments provide the opportunity to gut any true programs to mitigate the harm done by us. Why must we continue this thrust towards climate and earth collapse? Show some courage and integrity.

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

I am concerned that DEQ's current proposed rules regarding Oregon's Climate Protection Program (CPP) - which was adopted with overwhelming public support- requires big polluters to drastically cut their emissions over time by 2050.

The CPP is one of our strongest climate policies, and it's currently under attack, threatened by attempted rollbacks by polluting industries, leaving us with far-reaching consequences for the climate and our communities. The rollbacks would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Martha Neuringer

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely and unquestionably essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. It has the support of the citizens of Oregon.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By totally undermining the integrity of the CPP, the current proposed rule amendments will severely and intolerably compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. There is NO JUSTIFIABLE REASON to weaken this excellent program.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

The Climate Protection Program (CPP) is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. If you were to undermine the integrity of the CPP, you would severely compromise the program's intended public health, economic, and employment goals, and thereby cancel benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

This rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

**THERE IS NOTHING MORE IMPORTANT TO OUR SURVIVAL AS HUMANS ON THE EARTH THAN STOPPING CLIMATE CHANGE,**

**ONLY GOVERNMENT BODIES CAN GIVE COMPANIES THE RULES THAT SPUR THEM TO CHANGE. GIVEN THE NATURE OF OUR SYSTEM, THEY CAN ONLY STRIVE TO SURVIVE WITHIN THE COMPETITIVE RULES THAT EXIST. ONLY GOVERNMENT BODIES SUCH AS DEQ CAN CHANGE THAT WHOLE LANDSCAPE.**

**YOU MUST ACT TO PRESERVE US HUMANS AND OUR CHILDREN.**

Thank you.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Tracy Richards

Dear Oregon Department of Environmental Quality,

We have a climate crisis and the DEQ must act with the understanding that we are facing a crisis. In southwest Oregon we feel it in the very hot summer days, the wild fires and the smoke from the forest fires, and the drought conditions. We feel it in the changes in the growing seasons and harvest times. We need to strengthen the Climate Protection Program -- not weaken it!

So I Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

The CPP was adopted two years ago following a robust year-and-a-half long rulemaking process and extensive public input, including more than 7,600 public comments. I am concerned that DEQ's current proposed rules threaten to undermine this progress by enabling expansion of the fossil fuel industry in meeting Oregon's energy needs, severely compromising CPP's intended public health, economic, and employment goals and hindering progress towards environmental justice.

The emission reductions foreseen in the CPP can provide significant economic benefits by encouraging technological innovation and investments in clean energy, which will support regional job creation and deliverable public health benefits. I therefore strongly urge DEQ to amend the 2023 proposed rules to help ensure that Oregon stays on track to achieve the climate, health, and economic progress envisaged in the CPP.

Thank you.

Sincerely,  
Malcolm Costello

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the results of that progress.

As DEQ knows well, we are at a crucial climate crossroads. Although I fully understand the need to create more employment opportunities, especially in rural areas of the state, any decision made that increases a dependence on the use of more fossil fuels or the need to destroy already endangered habitat would be a deadly mistake - for all living things, us included.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve the necessary pollution and carbon reduction statewide and especially in those more vulnerable communities where industry so often refuses to listen to affected residents who are up against an imbalance of political power.

Thank you.

Sincerely,  
Jane Anderson

Dear Oregon Department of Environmental Quality,

Thank you and members of the rule making committee for all the good work you have done thus far. Please continue to reject efforts to weaken the Climate Protection Program (CPP).

Many thousands of outdoor enthusiasts consider tighter rules essential for reaching Oregon's pollution reduction goals. Don't let your extensive year-and-a-half long rule making process go for nothing! Keep your eyes on the goal and do not let the pressure groups sway your results!

However, those same thousands of outdoor enthusiasts, as well as other environmental groups, are concerned that DEQ's current proposed rules would substantially undermine the CPP. In particular, it appears the current version of the proposed rules would allow gas utilities to rely on some non-Oregon based facilities, thus enabling some large industrial emitters to bypass climate pollution controls in Oregon. In other words, the current proposed rule amendments could severely decrease the CPP's ability to attain its intended public health, economic, and employment goals, and reduce benefits for Oregon consumers, workers, local economies.

Please make certain to create and maintain guardrails and pathways for regulated entities to comply with Oregon's CPP and in rule making. Please make sure it is done well to ensure Oregon stays on track to achieve adequate climate goals, and to deliver public health, economic, and employment benefits for all Oregonians!

Thank you.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

While I care about creating good jobs in Oregon, it's important that we site industrial activities where they are not a substantial environmental risk (IE, our oil port on liquification ground on the Willamette). It is also important that data centers offset or have a plan to buy clean energy. If we want to incentivize this type of use in areas that depend on fossil fuel- we need to provide tax incentives to offset the increased costs of clean energy, if we feel like its a vital industry to the future of Oregon for at least the next decade. If not- than we need to figure out what industrial uses/companies can meet our targets (solar or wind manufacturing?, lower intensity uses, etc). We need to keep our eye on the long game.

The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Michael Herbert

Hello,

I support CPP to focus on the original goals of reducing greenhouse gas emissions by 50%- this is a meaningful investment for all Oregonians and to hold polluters accountable.

The time is now. Please choose wisely and with our future at the center.

Thank you

Karen Galloway

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

Climate change is here and worse than expected. Now is the time to strengthen the CPP, not weaken it. Please do not cave to fossil fuel related business interests, they have done enough harm already, without paying the price. We Oregonians want a strong CPP, please make sure it isn't weakened in this process. My kids need you to do this, all future generations need this.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Ingrid Edstrom

Dear Oregon Department of Environmental Quality,

You all worked hard to develop a strong CPP, yet there is pushback from businesses and organizations with less of a commitment to protecting our environment from global warming. Please hold firm on the rules as developed. We're all depending on you to protect the interests of the full community, not just those of a limited few.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
John Nettleton

Dear Oregon Department of Environmental Quality,

It is positively and absolutely ridiculous that, a state that claims to be so 'green' {and we're really not}, believes that it's a huge win that OR corporations will be cutting their emissions by 2050. So they have 27 years to keep polluting and we're just supposed to smile and wave and be grateful to them. ABSURD. This isn't a win for the environment by any means. It's still kowtowing to corporations and patting us on the head to placate us. You really want to help the environment, you'll have them cut pollution NOW.

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

This is no time to weaken climate goals. The severity of climate change is already apparent and no matter what we do it will get worse. The question is how much worse? Backsliding will lead to the most severe outcome. Do your part to keep it moderate.

Thank you.

Sincerely,

Dear Oregon Department of Environmental Quality,

We thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving Oregon's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process.

We are now concerned that DEQ's current proposed rules would effectively undermine the CPP:

Specifically, we're concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, thereby hindering benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

For the reasons outlined above, we strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits – ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for giving these comments your most serious and thoughtful consideration.

Sincerely,  
Dan and Mrs. Janet Blair

Climate Change Catastrophes are very obviously human caused, and humans are, and will be the victims of our own doing. The only questions are:

Why are we so far behind in dealing with this crisis?  
How many people will die before we do address it?  
How many people will die in total?  
How many people that don't die will be seriously affected by it?  
Why is anyone even thinking about listening to the people/ entities that have contributed the most to the crisis?  
Why aren't they being forced to pay for the damage they've caused?

Thank you.

Hello DEQ Representatives:

We are strongly opposed to any weakening of the Climate Protection Program originally proposed by DEQ and approved by the Environmental Quality Commission. Instead we urge the following:

- 1) Ignore efforts by the gas utilities to bypass the Community Climate Investment fund.**
- 2) Insist that the Best Available Emissions Reduction rules keep industry on a downward trajectory in emissions.**
- 3) Encourage the position that only hydrogen produced through electrolysis using renewable energy should be acceptable.**

Thank you,

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
William Obrien

Dear DEQ,

I live in Portland because of the city's strong commitment, at least on paper, to protecting the environment. I urge you to place the greatest possible restrictions on fossil fuel use and pollution. Isn't it obvious that we are ruining the entire ecosystem, including human civilization, through the use of fossil fuels? It is to many of us, and we need you to make rules that limit ALL use of fossil fuels now.

Thank you,

Dr. Teresa McFarland

Dear Oregon Department of Environmental Quality,

I appreciate the opportunity to provide comment on DEQ's important 2023 climate rulemaking. I believe that the Climate Protection Program (CPP) is absolutely essential to achieving our state's climate pollution reduction goals. As you know, it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I share the concern that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I'm concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended goals for public health, economic, and employment, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

This rulemaking would have far-reaching and potentially negative adverse consequences for the climate and communities in Oregon. The need for guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – would be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but can also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for this opportunity to submit public comments.

Sincerely,  
Randall Rasmussen

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,

Lindsay:

I was planning to offer oral testimony today at the EQCmeeting but cannot do so tomorrow because I have appointments all morning.

Thus, please find attached comments submitted to DEQ on the proposed rule from Southern Oregon Climate Action Now plus comments from the Climate, Energy & Environment Team of the Consolidated Oregon Indivisible Network and the Congressional District 2 Indivisible group.

Thanks,

Alan

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Please remember that.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. It is our health that is at risk without these safeguards in place.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,

Thanks for the opportunity to comment. We should not loosen our regulations and rules in any way. Gas utilities must figure out how to comply with our current rules. Large industries must be held accountable for their emissions. We are in (climate) crisis and businesses must step up and comply with strict emissions standards. The people of Oregon are relying upon the DEQ to do what's best for ordinary people and the environment, not businesses.

Thank you,

Rose Gerstner

Greetings, Department of Environmental Quality,

Please allow me to provide comment on DEQ's 2023 climate rulemaking, based on suggestions from the estimable Oregon Chapter of the Sierra Club.

By encouraging regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), careful rulemaking will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

It appears that DEQ's current proposed rules would effectively undermine the CPP— a program that is essential to achieving Oregon's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to discharge unregulated air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing these things will help ensure that Oregon stays on track to achieve our climate goals, and maximize associated job creation, cost saving, public health, and economic

development benefits— ensuring that these help Oregon communities, and are not exported out of state.

Thank you for considering these comments.

Sue Cole

Eugene resident and concerned US citizen

Dear Oregon Department of Environmental Quality,

The Climate Protection Program (CPP) is absolutely essential to achieving our state's climate pollution reduction goals. Adopted with overwhelming public support, following an extensive 18 month rulemaking and stakeholder engagement process, it reflects Oregonians' commitment to protecting our people, our state's resources, and its many environs.

DEQ's current proposed rules would effectively undermine the CPP.

Specifically: one proposed rule allows regulated gas utilities to rely on out-of-state biomethane investments- like importing damaging gasses into our state would be a good thing.

Another proposal would allow expansion of new large industrial emitters, and likely unfettered climate pollution in Oregon. OREGONIANS DO NOT WANT UNFETTERED EMISSIONS. Enough with the wild West mentality already.

By undermining the integrity of the CPP, the current proposed amendments severely compromise the program's intended public health, economic, and employment goals, and hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. All for the profits of those out-of-state biomethane investors and large industrial emitters.

It's worth remembering that most large industries do not pay their share of taxes, but do rely on the government to pay for any damage they do to public health and lands.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Joanne Cvar

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Usha Honeyman

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Christine Kondrat

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Philip Ratcliff

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Carol Wagner

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Catherine Goodfellow  
322 Rebecca St Syracuse, NY 13212-2035  
[lynn1goody@yahoo.com](mailto:lynn1goody@yahoo.com)

Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic

development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**From:** [Kathy Moore](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program.  
**Date:** Friday, September 15, 2023 9:30:43 AM

---

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to

reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Kathy Moore

## Testimony for EQC, DEQ Climate Rule Making without the 2 minute limit

Good afternoon [**EQC**: Chair George, Vice Chair Baraso, members of the Commission].

My name is Rene Braga and I'm a community member that has suffered the loss of family and property due to global warming related disasters. Thank you for the chance to comment on DEQ's 2023 climate rulemaking. This process has significant implications for Oregon's climate and communities. It's crucial for this rulemaking to effectively set guidelines for compliance with the Climate Protection Program (CPP). When executed effectively, it will play a critical role in keeping Oregon on course to meet our climate objectives and bring benefits to environmental justice communities in terms of public health, the economy, and employment.

I'm deeply troubled by the current proposed rules from DEQ, as they appear to weaken the CPP. This program is absolutely crucial for achieving our state's climate pollution reduction objectives and was established with overwhelming public backing, after an exhaustive 18-month rulemaking and stakeholder engagement process.

The DEQ bears the crucial responsibility of safeguarding the alignment of the Climate Protection Program with its climate objectives, while concurrently delivering substantial public health, economic, and employment advantages to communities within Oregon. It is of paramount importance that the DEQ takes **substantial** measures to enhance the existing proposed regulations in the following ways:

1-Imposing stringent limitations on the utilization of biomethane, also known as renewable natural gas (RNG), and hydrogen for the purposes of CPP compliance, ensuring that these resources **exclusively** yield direct benefits for the residents of Oregon.

2-Bolstering the criteria for emissions reduction within new or expanded large-scale industrial facilities operating in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

And Last, Since the 2021 adoption of the final CPP rules, Oregon's industrial sector has witnessed a concerning rise in emissions. For instance, Amazon is pursuing multiple

permits for energy-intensive fossil gas-powered data centers in Eastern Oregon, which will significantly escalate gas consumption and greenhouse gas emissions. We demand the rules be updated, strengthened and always concentrated on looking out for the health of our communities and not the savings in revenue, of billion dollar corporations. Thank you

En Solidaridad,  
Rene Braga  
Rogue Valley Community Organizer

Greetings,

I'm writing to comment on DEQ's proposed climate protection rules. While this is a strong set of proposals overall, which will help Oregon meet its climate goals, I would like to highlight the need for three areas of improvement:

First, RNG or biomethane, while potentially mitigating some carbon pollution, should not be considered a "renewable energy source" for export--this risks creating a perverse incentive for unsustainable methane producers such as confined livestock operations. Using this product for onsite or local energy production would be acceptable as long as it does not promote increased overall methane release.

Second, large stationary producers should be held to more stringent emissions standards when seeking permits for new or expanded facilities.

Finally, violators should be encouraged as strongly as possible to mitigate emissions and other violations either through self-initiated actions or through supplemental environmental projects; any possible incentives to turn penalties into meaningful solutions should be pursued.

Thank you,

Eric Butler

Please accept these comments regarding the DEQs 2023 Climate Rulemaking.

My name is Brian Stewart, I am co-founder of Electrify Now.

Thank you Chair George and members of the commission for the opportunity to provide comment today on DEQ's 2023 climate rulemaking.

The Climate Protection Program is potentially one of the most significant tools that Oregon has to reduce climate pollution in our state and it has been designed to bring health and economic benefits to the residents of our state. But this program will only be effective if the details of the rules support the purpose of the program.

**I am very concerned that DEQ's current proposed rules would effectively undermine the purpose of the CPP and I would remind the commission that this program was adopted with overwhelming public support following an extensive stakeholder engagement process and designed to benefit the residents of Oregon.**

The proposed rules would undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits particularly for environmental justice communities across the state.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane or hydrogen investments and would enable the expansion of new large industrial carbon emitters.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which is produced here in Oregon and provided direct benefits for Oregonians and not allow out of state RNG credits
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

These updates are critical to ensure that Oregon stays on track to achieve our climate goals and maximize the associated job creation, cost saving, public health, and economic development benefits here in Oregon.

Thank you for the opportunity to provide comments.

Brian Stewart

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Regards,  
Sandy Small

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CPP) is a program that is absolutely essential to achieving our state's climate pollution reduction goals, and it was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Deborah Buckley  
5818 NE Mason St Portland, OR 97218-2212

To: EQC Chair George, EQC Vice Chair Baraso, Members of the Commission, and DEQ staff  
From: Lisa Adatto, Lake Oswego Resident  
Re: DEQ's 2023 Climate Rulemaking  
Date: September 15, 2023

Good afternoon and thank you for accepting my written testimony. I have worked on climate issues for twenty years. I have been alarmed ever since my father, a University of Oregon scientist, told me about global warming, caused by fossil fuels, 50 years ago. I was one of the founders of the Lake Oswego Sustainability Network (LOSN). We promote sustainable practices in our city. Local surveys show that climate change is a top priority for our residents.

The Climate Protection Plan is a key tool that Oregonians have adopted to reduce dangerous climate pollution. Global Warming is affecting our lives: in the summer of 2023 we have experienced unbearable smoke infecting many of our most beautiful communities, we have seen precious forests burn, and around the world we watch people suffering from extreme heat, flooding, and drought. We see vacations ruined, crops fail, and people losing homes and lives. Oregon is on the right track to focus on reducing our portion of greenhouse gasses.

The strategy we are following relies on a transition away from fossil fuels to low carbon energy such as wind power, solar power, wave and geothermal power, hydropower and nuclear power. With clean electric power we electrify our heating, cooking, landscaping equipment and cars. This transition creates jobs, reduces pollution, improves health, saves money, and creates a safe future for following generations.

Unfortunately, the newest proposed draft of the CPP goes in a different direction and could lead to increased greenhouse gasses. The current rules include a loophole that would allow regulated gas utilities to rely on out-of-state biomethane investments to meet CPP requirements. This could lead to the expansion of large industrial emitters which could increase greenhouse gasses – it would undermine the whole purpose of the CPP.

I strongly urge you to amend the proposed rules by

- Restricting biomethane and hydrogen used for CPP compliance
- Strengthen emissions reduction requirements for new stationary source facilities in Oregon under the Best Available Emissions Reduction program.

I also strongly support

- Maintaining protective restrictions on biomethane accounting in the current rules
- Maintain the rule that synthetic methane derived from anthropogenic carbon sources does not comply the CPP.

All the best,

Lisa Adatto  
1960 Egan Way  
Lake Oswego, Or.

Dear Oregon Department of Environmental Quality,

As a third generation Oregonian, I appreciate the opportunity to provide comment on DEQ's 2023 climate rulemaking. I am encouraged by the mere existence of the Climate Protection Program (CPP) and understand that it is vital to achieving our state's climate pollution reduction goals. I share the in the overwhelming public support generated by an extensive 18 month rulemaking and stakeholder engagement process.

I am profoundly disappointed that the DEQ's current proposed rules would effectively undermine the CPP--allowing regulated gas utilities to rely on out-of-state biomethane investments, and permitting the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will weaken the program's intended public health, economic, and employment goals, and undercut benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

As DEQ has to comprehend, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone CPP, if done as was expected, will be absolutely vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I therefore strongly urge DEQ to amend the proposed rules to help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits-- ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you.

Sincerely,  
Connie Peterson

Dear Sir/Miss:

The Oregon Department of Environmental Quality (DEQ) must ensure the Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities. Specifically, it is vital that the DEQ strengthen its current proposed rules by:

1. Restricting biomethane (aka renewable natural gas (RNG)) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

**As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.**

3. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.
4. I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.
5. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.
6. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.
7. I strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does *not* comply with the CPP.
8. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported

out of state.

Thank you for your attention and for accepting comments.

Margaret Quentin

## DEQ Rulemaking Comments

My name is Linda Perrine a volunteer with Electrify Oregon, a group working to educate Oregonians on home electrification and IRA incentives and rebates.

Thank you Chair George and members of the commission and staff for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

The Climate Protection Program is potentially one of the most significant tools that Oregon has to reduce climate pollution in our state and it has been designed to bring health and economic benefits to the residents of our state. But this program will only be effective if the details of the rules support the purpose of the program.

I am very concerned that DEQ's current proposed rules would effectively undermine the purpose of the CPP and I would remind the commission that this program was adopted with overwhelming public support following an extensive stakeholder engagement process and was designed to benefit the residents of Oregon.

The proposed rules would undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits particularly for environmental justice communities across the state.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane or hydrogen investments and would enable the expansion of new large industrial carbon emitters.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which is produced here in Oregon and provided direct benefits for Oregonians and not allow out of state RNG credits.
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system.
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

These updates are critical to ensure that Oregon stays on track to achieve our climate goals and to maximize the associated job creation, cost saving, public health, and economic development benefits here in Oregon.

Thank you for the opportunity to provide comments.

Linda Perrine  
Lincoln City, OR

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
E. Darby

As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
MARY PETERSON

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:
