But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Twin Eagle is a non-covered marketing entity.

Twin Eagle appreciates the opportunity to provide comments regarding the latest proposed rule changes under the Discussion Draft Rules – Division 215 Climate 2023 Rulemaking Advisory Committee GHG Reporting Program.

Twin Eagle believes a deliberate omission of electrolytic hydrogen and other waste feedstocks as components in biomethane and renewable natural gas will be detrimental to the progress of the CPP. We believe the current proposed language prohibits the participation of “Renewable Hydrogen” derived fuels as part of the Climate Protection Program.

We believe the commission should include additional language under “Biogas”, “Biomethane”, and “Renewable Natural Gas” to support Power-to-X fuels.

The attached comments are to help and ensure that DEQ does not impermissibly preclude renewable fuels made from certain renewable biomass and renewable resources from participating in the CPP program. Our proposed changes and definitions are to help advise the committee on how best to achieve the stated goals of the CPP.

Please find attached our comments.

Best,

**Tyler McQueen**

Dear Chair George, Members of the Environmental Quality Commission, and DEQ staff,

Regarding DEQ's Climate 2023 Rulemaking, it is clear that an enormous amount of work, expertise, and care went into the proposed rules. I thank you for considering public comment to improve the rules further— I strongly urge you to amend the proposed rules in three ways in order to fulfill the aims of the Climate Protection Program (CPP). I urge you to:

1. Eliminate the option to use out-of-state biomethane or hydrogen for CPP compliance,
2. Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program, and
3. Regulate both biomethane and hydrogen across additional health and safety metrics that are essential to achieving the CPP aims of reducing other air pollutants and improving public welfare for Oregon communities.\*

I care about this because:

First, as a current resident of Tillamook County and a member of the Climate Reality Project, I am acutely aware of the dangers of climate-change fueled storm surge, flooding, and wildfire risk and fully support climate protection.

Second, having friends in Richmond and Rodeo (California), I know the long-term health harms they have suffered from regular flaring pollution from high temperature hydrogen production. It doesn't matter whether that hydrogen is produced from biogas, biomass, or landfill waste instead of fossil fuels— the flaring risk remains high for all of those pathways. The only safe hydrogen production is green electrolytic production at low temperatures.

Third, about three years ago a "natural gas" (methane) line exploded in my acquaintance's apartment building— he was hospitalized with third degree burns for almost two months, barely saved his elderly neighbor's life, and lost his dog and cat to the flames. The explosion risk of methane is the same whether the methane is "bio" or "fossil."

Fourth, it is clear that solutions like biomethane cannot be solutions at scale. The supply of waste from which to create biomethane is limited— Oregon DOE estimates that gross potential for production is only between 4.6 and 17.5% of Oregon's yearly natural gas usage. Any biomethane policy that incentivizes additional waste production would be harmful to Oregonians, add greenhouse gas emissions, and in

the case of incentivizing additional cow manure, would directly affect water quantity and quality. Additionally, biomethane leaks just like fossil methane, adding extremely potent greenhouse gas — with a global warming potential 86 times that of carbon dioxide over a 20 year period, and a 100 year GWP of 25— to our atmosphere from every leaking production site, pipe, or appliance.

Fifth, for homes and vehicles, direct electrification is several times more efficient than hydrogen— this means direct electrification can serve more needs more affordably. Don't let "hydrogen creep" cut into Oregonians' wallets and energy security— create rules to limit hydrogen to 1) uses that cannot otherwise be decarbonized such as fertilizer and steel production and 2) the amounts that can be produced electrolytically using solar or wind energy that is in excess of grid needs.

It's essential that Oregon's climate rules address the climate crisis in ways that help people in real life. Because GHG calculations on spreadsheets often leave out important metrics, the spreadsheets don't tell the whole story. Considering pollutants other than GHGs, public safety, and water and food security is necessary for real climate protection.

Thank you in advance for upholding all four of the Climate Protection Program's aims in your final rule-making. Reduce greenhouse gas emissions, accelerate the phase-out of fossil fuels, reduce other air pollutants, and improve public welfare for Oregon communities, particularly environmental justice communities.

Sincerely,  
Helena Birecki  
resident of Tillamook County, OR

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. The Climate Protection Program was adopted with overwhelming public support following an extensive stakeholder engagement process and was designed to benefit the residents of Oregon.

The proposed DEQ rules would undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits

particularly for environmental justice communities across the state.

I strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which is produced here in Oregon and provide direct benefits for Oregonians and not allow out of state RNG credits.
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system.
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

These updates are critical to ensure that Oregon stays on track to achieve our climate goals and to maximize the associated job creation, cost saving, public health, and economic development benefits here in Oregon.

Thank you.

Dear Commissioners,

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
Andrew Loia

Chair George, Vice Chair Baraso, members of the Commission:

My name is Troy Winslow and I am a volunteer with Families for Climate. I am a parent to Aldous & Sullivan. I am writing this testimony because as their parent, my most fundamental responsibility is to protect them from harm, and irreversible climate change gravely threatens their future.

The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science. However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

**Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.

**Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Troy Winslow

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** 2023 Climate Rulemaking  
**Date:** Thursday, September 28, 2023 8:35:39 PM

---

You don't often get email from ben.demilo@gmail.com. [Learn why this is important](#)

Chair George, Vice Chair Baraso, members of the Commission:

My name is Ben Stickney, I am a Portland resident, a father, and I am a volunteer with Families for Climate. I am writing this testimony as my most fundamental responsibility to protect my children from the harm of irreversible climate change that gravely threatens their future.

The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science. However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

1. **Eliminate provisions permitting biomethane (aka renewable natural gas (RNG) used for CPP compliance.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.
2. **Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality. As one example, Amazon is seeking multiple permits to build or expand operations at several energy-

intensive, fossil gas-powered data centers in Eastern Oregon; these data centers alone will result in an enormous increase in gas use and GHG emissions. Further, in the 2023 legislative session, lawmakers adopted the “Oregon CHIPS Act,” which provides \$210 million in funding and creates land use exemptions to accelerate the development of semiconductor plants or other advanced manufacturing facilities. While the economic prospects of industrial innovation is a tantalizing opportunity for the state, expansion must be measured against environmental harm that may result from fast-tracking expanded operations.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so they can protect our children’s future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Dear Department of Environmental Quality Members:

Thank you for providing space for residents to offer their perspectives during the DEQ's 2023 climate rulemaking. I write as a concerned educator and researcher of environmental, climate, and energy justice studies—as well as a Willamette Valley resident for many years. As those of us who participate in policymaking know, this rulemaking carries significant impacts for the environments we live and work in throughout Oregon.

The Climate Protection Program (CPP) marks an indispensable framework, and for this plan to be implemented successfully, a rulemaking process that values environmental, climate, and energy justice and equity is essential for ensuring Oregon can achieve its climate goals. These goals are required to support equitable public health and employment benefits for communities experiencing the greatest negative impacts of global heating and climate-fueled disasters in Oregon. I am concerned that if the rulemaking process continues to support the powerful influences and interests of corporate polluters, especially those representing the fossil fuel industry, then there will be serious consequences that will further marginalize and harm environmental and climate justice communities (i.e., rural, low-income and low-wealth, and Black, Indigenous, and other People of Color communities).

I am gravely concerned that the DEQ's current proposed rules would work against the CPP. This program is vital for reaching our state's climate pollution reduction goals. The CPP also received overwhelming public support following an extensive 18-month rulemaking process that included significant stakeholder engagement. Unacceptably, the DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments. Additionally, the current rules risk the expansion of large industrial polluters. These new emitters will continue fueling climate disruption, while polluting Oregon's air and land. The DEQ's current support for corporate polluters threatens the CPP's intended public health, economic, and employment goals. With these major aspects of life and wellbeing in jeopardy, Oregon workers, local economies, and environmental and climate justice communities across the state will suffer and have to continue expending their limited energy and resources to work against ongoing and expanding injustices and inequities. Therefore, in solidarity with Beyond Toxics and other aligned environmental and climate justice advocacy groups, I urge the DEQ to amend the proposed rules by:

- Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Allowing covered fuel suppliers to rely on out-of-state biomethane presents the deeply concerning likelihood that investments will be diverted from the Community Climate Investment (CCI) program; and
- Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Thank you for considering my written testimony. I hope the DEQ will side with Oregon

residents who know that climate protections are vital. We must act now to support all people living in the state--especially communities marginalized and harmed by dominant systems of power that continue to exploit and devalue rural, low-income and low-wealth, and Black, Indigenous, and other People of Color communities.

Sincerely,

Catalina de Onis, PhD  
Eugene resident  
Energy and climate justice educator and scholar

Hello my name is Elliott Grey

Thank you Chair, members of the commission and staff for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

The Climate Protection Program is potentially one of the most significant tools that Oregon has to reduce climate pollution in our state and it has been designed to bring health and economic benefits to the residents of our state. But this program will only be effective if the details of the rules support the purpose of the program.

**The current proposed rules would effectively undermine the purpose of the CPP. This program was adopted with overwhelming public support following an extensive stakeholder engagement process and was designed to benefit the residents of Oregon not big business!!!**

The rules proposed undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits particularly for environmental justice communities across the state.

DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane or hydrogen investments and would enable the expansion of new large industrial carbon emitters.

I strongly urge DEQ to amend the proposed rules:

- 1) Restrict biomethane for CPP compliance to that which is produced here in Oregon and provided direct benefits for Oregonians and not allow out of state RNG credits.
- 2) Disallow hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system.
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Oregon must stay on track to achieve our climate goals! Public health, and economic development are at great risk. It's time to take a strong stand and keep the benefits here in Oregon.

Thank you for the opportunity to provide comments.  
Elliott Grey

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
rhonda I  
Beaverton, Oregon, 97008, United States

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Beth Levin

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

The following is absolutely a script. I didn't write it. But I've read it, and I mean every word.

We cannot keep doing this. We cannot stay dependent on oil and burning this planet up to a point where life cannot be sustained. Do the right thing. Capitalism cannot be the way we die. It's pathetic, and we're smarter than this. It's time to act like it.

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. [You don't often get email from [ciri5447@everyactioncustom.com](mailto:ciri5447@everyactioncustom.com). Learn why this is important at <https://aka.ms/LearnAboutSenderIdentification> ]

Dear Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision-making. Careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families

and communities.

Sincerely,  
Sharon E Ciri

Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

The passage of the Climate Protection Plan (CPP) is an important step towards reaching our climate safety goals. As with any legislation, the success of the outcome is due to the specifics in the rule-making process.

We are very disturbed to see the make-up of the advisory committee. We note that of 14 members, only two are public interest groups and are concerned that regulated industries' input will not serve the public interest.

The current concessions to regulated industries allow out-of-state RNG bio-methane investments and could enable the expansion of new industrial emitters, defeating the goals of the CPP. The current proposed rule amendments will compromise the program's intended public health, economic, and employment goals, and hinder benefits for Oregon consumers, workers, local economies, and communities across the state.

We are also concerned that this type of out of state investment would divert money from the Community Climate Investment fund, created specifically to focus on benefits to Oregonians.

We see Northwest Natural Gas is already seeking to comply with the CPP by purchasing Renewable Thermal Certificates associated with RNG outside of Oregon. Please strengthen requirements by restricting bio-methane used for CPP compliance to that which would produce direct benefits to Oregonians.

Finally, we ask you to strengthen the emissions reduction requirements for new or expanded stationary source facilities in Oregon under the BAER Act. These large emitters must pivot to use their economic base to be part of the solution, not part of the problem.

This rule-making is vital to ensure this program stays on track to achieve its stated climate, public health, and economic goals. You are in a crucial role to make sure this actually happens.

Thank you for your attention to this matter,

Liz & Dave Fox

Department of Environmental Quality,

My name is Drew and I live in Eugene.

I care deeply about our climate, and Oregon's role to lead.

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Members of the DEQ rule making committee:

Thank you for the opportunity to submit comment. I am concerned about your rule making process as I see that the advisory committee is almost all industry. I am not confident that an industry led committee will be effective in creating rules that benefit the health and safety of Oregonians as their focus is to preserve their industries which we know must change. It is a daunting task we all face, changing everything related to our energy sourcing; but it has to be done, with knowledge that our time is very short to avert climate tipping points.

In Eugene we see how the gas industry can manipulate public opinion through large expensive campaigns to overcome our electrification ordinance, at least for the present.

The compromise to industry to allow out-of-state RNG bio-methane investments as offsets would defeat the goals of the Climate Protection Plan, which focus on direct benefits to Oregonians, it seems this would divert monies from our Community Climate Investment fund.

Northwest Natural Gas is already trying to comply with the CPP by purchasing Renewable Thermal Certificates associated with RNG outside of Oregon. Please strengthen requirements by restricting bio-methane used for CPP compliance to that which would produce direct benefits to Oregonians.

We know our energy source must pivot. I would like to strongly encourage your committee to research Geothermal opportunities as an electrical caseload option. There are 17 projects in oil and gas states. Texas is looking to begin pivoting. Oregon shows up a a prime location for a geothermal plant. There is already a small plant in eastern Oregon that Idaho benefits from.

We do not have time to fight oil and gas production. We must advocate for them to pivot their operations and begin investing in geothermal production. We also cannot afford the years that will be wasted fighting among ourselves over Small Nuclear Reactor. Geothermal is safe and fills the requirement for caseload electricity.

Our large fossil fuel emitters must pivot to use their economic base to be part of the solution, not part of the problem. There is excellent presentations on geothermal energy development on the Volts podcast of 3/31/23 and again on 7/31/23. Please research and support bringing federal funding into the state to help our utilities pivot.

Thank you for the opportunity to comment.

Dear DEQ professionals,

I graduated from the UO ENV Studies program years ago and am now a mental health professional in Eugene.

It makes perfect sense that environmental degradation affects our physical and emotional lives tremendously... afterall we are not seperate from nature or each other (the world over). A strong majority of Oregonians polled are worried about climate change! By 'change' we all know that actually means 'destabilization.'

Please cut through confusion and use your voices of leadership to advocate for environmental \*caution\* by turning down the volume of outsized voices in industry! Most Oregonians don't have the capacity to track these important details but we know they're important and find out eventually whether our leadership has had our back.

I appreciate all the research and careful recommendations of Eugene's 350 group. Thanks also for what YOU do, including all that may go unrecognized to protect us.

My name is Lauren Fraser from Energize Bend, a local nonprofit supporting residential energy efficiency, renewable energy, and electrification.

Thank you Chair George and members of the commission and staff for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

The Climate Protection Program is potentially one of the most significant tools that Oregon has to reduce climate pollution in our state and it has been designed to bring health and economic benefits to the residents of our state. But this program will only be effective if the details of the rules support

the purpose of the program.

**I am very concerned that DEQ's current proposed rules would effectively undermine the purpose of the CPP and I would remind the commission that this program was adopted with overwhelming public support following an extensive stakeholder engagement process and was designed to benefit the residents of Oregon.**

The proposed rules would undermine the intended objectives of the program by reducing clean energy projects built here in Oregon, meaning fewer jobs and other local economic benefits particularly for environmental justice communities across the state.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane or hydrogen investments and would enable the expansion of new large industrial carbon emitters.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which is produced here in Oregon and provided direct benefits for Oregonians and not allow out of state RNG credits.
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system.
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

These updates are critical to ensure that Oregon stays on track to achieve our climate goals and to maximize the associated job creation, cost saving, public health, and economic development benefits here in Oregon.

Thank you for the opportunity to provide comments.

Lauren Fraser

I'm concerned that the current concessions to regulated industries allow out-of-state RNG bio-methane investments and could enable the expansion of new large industrial emitters, defeating the goals of the Climate Protection Plan (CPP). The current proposed rule amendments will compromise the program's intended public health, economic, and employment goals, and hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I'm also concerned that this type of out of state investment would divert money from the Community Climate Investment fund, created specifically to focus on benefits to Oregonians.

Please strengthen requirements by restricting bio-methane used for CPP compliance to that which would produce direct benefits to Oregonians. Implement this Oregon program to benefit Oregonians. Oregon taxpayer money is best used to benefit companies that operate in Oregon while supporting Oregon workers and Oregon communities.

Do not bend to corporate and out-of-state pressures to bleed the Climate Protection Plan for profiting non-Oregon entities.

Rouanna Garden

To all whom it may concern in the Department of Environmental Quality:

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will ensure that our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for communities throughout Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences for communities if the CPP is weakened in response to lawsuits from corporate polluters.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and affected communities across the state. I therefore strongly urge DEQ to amend the proposed rules in the following ways

- 1) Restrict biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and

- 2) Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

3) Maintain protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.

Thank you for your attention to these vital issues.

Sincerely,

Thomas I. Ellis

Department of Environmental Quality,

The Climate Protection Program is a historic policy achievement with a lot of potential upsides, as long as it continues to be rigorously updated and the integrity of its goals is maintained.

I'm submitting the following comments on behalf of Building Resilience – a statewide coalition of climate justice and public health, business and labor, faith and frontline communities, environmental, family, and youth organizations. Our mission is to promote access for all Oregonians to healthy, affordable, resilient homes and buildings that run on clean electricity.

One of the innovations of this program, which the Environmental Quality Commission adopted with overwhelming public support, was its focus not only on reducing greenhouse gas pollution, but to the benefit of the health and well-being of Oregonians who are harmed by fossil fuels. The program's mission is to reduce climate pollution **and** to deliver public health improvements and benefits to our local economy, with particular focus on environmental justice communities.

We're concerned that the new rules under discussion by DEQ now are too loose and may undermine the mission of delivering these multiple benefits to Oregonians– like cleaner air, good-paying jobs, and community improvement.

Specifically, DEQ is considering allowing regulated methane gas utilities to rely on out-of-state biomethane projects, thousands of miles from here, rather than local projects or Community Climate Investments to benefit the people of Oregon.

We recommend restricting biomethane and hydrogen investments to reduce fossil gas pollution to those that directly benefit Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline *within Oregon*. Additionally, we would like to see stronger guardrails in the new rules to ensure only "green" electrolytic hydrogen, made using renewable energy, is used for program compliance and more polluting sources of hydrogen are disallowed.

Doing so will help ensure Oregon achieves climate pollution reduction and will also maximize the associated job creation, cost savings, public health improvement, and economic development benefits locally.

One bright spot of the rules is the exclusion of synthetic methane as a way to comply with the program. We encourage DEQ to hold the line on that treatment.

Thank you for all you do for Oregon.

Brad Reed (he/him)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,

Dear Commissioners,

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that the Department of Environmental Quality (DEQ)'s draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. For the CPP to deliver, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. Hydrogen is a leak-prone gas, and the risks of hydrogen leakage must be incorporated into our decision-making.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Best Available Emissions Reduction (BAER) assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

Thank you for your consideration,

Sincerely,  
Alicia Gruber

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Virginia Wiltshire-Gordon  
730 NE Weidler St

Dear Oregon Department of Environmental Quality,

The science is clear—we have less than a decade to cut greenhouse gas emissions in half to avoid catastrophic and irreversible climate impacts. Oregonians are already experiencing dangerous climate and health impacts as a result of fossil fuel use, with communities of color, low-income households, and rural communities bearing a disproportionate burden.

But Oregon hasn't done enough to lock in the emissions reductions that we know are needed to achieve critical climate goals. Our state is still 19% short of meeting our 2020 emissions reduction target, and does not have sufficient policies in place to put us on track to achieve President Biden's nationally determined contribution (NDC) commitment to cut U.S. emissions in half from 2005 levels by 2030. Without additional policies and programs in place to slash dangerous greenhouse gas emissions, Oregon will continue to fall short – putting lives and livelihoods at risk.

We need to increase our climate ambition, and we can't miss any opportunities to strengthen Oregon's climate programs. The Climate Protection Program (CPP) makes our state only the third in the nation to place an enforceable, declining cap on emissions from transportation and natural gas fuel usage. This program is critical for holding polluters accountable, and we can't accept any weakening of the CPP.

I am concerned that DEQ's draft rules will weaken Oregon's Climate Protection Program. The final rules for DEQ's Climate 2023 rulemaking must:

**ENSURE CLIMATE, ECONOMIC, AND PUBLIC HEALTH BENEFITS FOR OREGONIANS.** DEQ's draft rules will determine how biomethane and hydrogen are used for compliance with the CPP. I urge DEQ to restrict biomethane used for CPP compliance to that which produces direct benefits for Oregonians, rather than allowing natural gas companies to rely on out-of-state biomethane investments. For the CPP to deliver the climate, economic, and public health benefits that we need, we can't allow natural gas companies to rely on out-of-state biomethane projects for compliance instead of cutting pollution right here, in our home state. It's also critical that the full environmental impacts of biomethane and hydrogen fuels are reflected in compliance obligations under the CPP. Hydrogen is a leak-prone gas with a potent warming effect, and the risks of hydrogen leakage must be incorporated into our decision making. And careful accounting is needed to accurately reflect the climate impacts of biogas, which are dependent on both source and injection methods.

**REQUIRE INDUSTRIAL SOURCES OF EMISSIONS TO CUT CLIMATE POLLUTION IN LINE WITH THE CPP'S DECLINING CAP.** All large industrial emitters must be held accountable for their greenhouse gas emissions. Comprehensive coverage of climate pollution is critical, and I urge DEQ to ensure that any new stationary source or proposed modification with the potential to emit greenhouse gasses in any quantity is required to complete a best available emissions reductions (BAER) assessment. BAER assessments must be transparent, with members of the public given a meaningful opportunity to provide review and input. And

most importantly, these BAER assessments must be translated into concrete requirements to reduce emissions in line with science-based goals. Under the CPP's current approach, industrial emissions are exempted from binding emissions reduction requirements consistent with the CPP's declining emissions cap. These industrial sources are responsible for approximately 20% of Oregon's total emissions, and modeling suggests that their emissions will continue to increase over time. It's unacceptable that emissions from these sources could continue to increase under the CPP, placing Oregon's climate future at risk. DEQ must ensure industrial polluters face binding requirements to cut emissions in line with the CPP's declining cap.

This rulemaking will have important consequences for Oregon's ability to cut climate pollution and hold polluters accountable. It's essential that this rulemaking delivers a stronger CPP that prioritizes benefits for Oregon's families and communities.

## DEQ and EQC Commissioners

The Climate Protection Plan is an excellent effort by DEQ to reduce climate pollution and create a healthier Oregon. I am concerned that businesses with a vested interest in keeping the status quo continue to try to weaken the rules. I urge DEQ to strengthen the Climate Protection Plan rules, close loopholes and ensure that the Community Climate Investment Program not only assists the poorest and most adversely impacted populations in Oregon but contributes significantly to reduction in greenhouse gas emissions. I know DEQ, with the direction and support of the EQC, can do this.

I lobbied hard for the Clean Energy Jobs bill that would have created a cap and invest program in Oregon thereby reducing climate pollution and providing funds for development of clean energy and harm reduction programs. I saw that polluting industries in Oregon lobbied hard against the bill. A number of these same industries are on the Rules Advisory Committee and continue to advocate for the status quo or minor changes that advance their interests and do not help solve the issue of ever increasing greenhouse gases in our atmosphere. This disregard for the health of our community and blindness to adverse consequences led me to electrify my 1925 duplex in Portland and cut the gas off at the street.

Cleanly generated electricity is one solution to emissions from transportation and buildings, the two biggest contributors to carbon emissions in Oregon. We need programs that promote clean electricity and help to build that infrastructure. I am especially frustrated with the behavior of the methane gas companies in the State of Oregon. They are, individually and collectively, fighting to keep the status quo. Any good business executive knows that when the external market shifts the business must adjust. The methane gas companies are not taking the changing market into account. They have viable business alternatives that they are not pursuing even as they advertise '*choice of fuel*' and beg customers to '*save their employees' jobs*' even as they try to increase customer costs. There will be no one to blame for the demise of the gas companies except their leadership's failure to adapt to changing energy needs.

I suppose one could argue that the market has not yet forced this change but the logical outcome of market forces has been obvious for years. It has also been obscured by direct fossil fuel company actions and advertising. Solar and wind energy is clean and becoming cheaper every year. Climate Pollution is an existential risk to all inhabitants of our planet and the situation becomes more dire every year. A future focused and ethical company would have started the transition away from fossil fuels years ago. These big polluters keep trying to prolong the process. It is the responsibility of the Department of Environmental Quality to stop them and protect our environment, health and economy.

Moreover, these companies have alternatives that could keep them in business and protect their workforce. NW Natural methane Gas, Avista, and Cascade Natural methane Gas could follow the example of the gas company in Vermont that is moving into the clean energy equipment and heat pump business [https://youtu.be/8i\\_QnOiy1eA](https://youtu.be/8i_QnOiy1eA). Forming in-ground heat pump hubs would provide extremely efficient heat pumps to neighborhoods (usually a one or

two block network) at a reasonable cost to customers and create an ongoing source of income for the company as they maintain and provide heating and cooling to the customers in the hub. Of course they would need pipefitters to create and maintain the network of pipes and heat transmitting fluids in them.

These companies have alternatives to gas to stay in business. Apparently they need DEQ and the EQC to give them the push to move forward. Please push and push hard. I, for one, will not fault the program if some of the Community Climate Investment Funds go to setting up in-ground heat pump hubs in low income neighborhoods. Rural Oregon would benefit because in-ground heat pumps operate more efficiently in cold weather than the more common air heat exchange.

Thank you for the opportunity to comment. Please make the CCP and the CCI stronger.

- No credits for out of state projects - Oregon programs should benefit Oregonians.req
- Skip the proposed renewable methane and hydrogen path.
  - Methane is methane
  - Providing electrical solutions to buildings is more efficient than using it to cleanly create hydrogen.
- Require rapid, meaningful reductions in greenhouse gas emissions.
- Help the gas companies become true innovators in providing clean energy.

Good morning Nicole and Elizabeth,

My name is Mike and I recently started at PacifiCorp covering GHG policy with Zepure and Patty, who are PacifiCorp's Climate 2023 advisory committee members. I have two questions regarding the Climate 2023 proposed rules released a few weeks ago.

The first is regarding the definition change under Division 215 from "air contamination resource" to "stationary source and electric power system facility." I did not see the definition change raised in prior presentations or comments so I'd like to get a better sense of whether this is just regulatory cleanup or something else. Can you provide any clarity on the change?

Also in Division 215, proposed rules add a requirement that electric companies and service providers report and identify electricity and GHG associated from net metering facilities and PURPA QFs. We will file our comments on how we think this can be best implemented but I'd like clarification on whether electric companies would report total electricity and GHGs from net metering and QFs (like [RE 39](#)) or if each resource would need to be listed and reported individually. I hope the former given the sheer number of facilities on our system but it could be read as the latter with the way it is written. Alternatively, could a large subset of customer categories (e.g. rooftop solar customers) be aggregated to a single value?

Thank you in advance for any insight you can provide. These will help steer our comments appropriately.

Best,  
Mike

Mike Sullivan

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Susan Menanno

Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Richard Barker

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 2:23:08 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Julie Buchenau

**From:** Lindsay Benedict <campaigns@good.do>  
**Sent:** Wednesday, October 4, 2023 2:32 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost-saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Lindsay Benedict

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 2:37:47 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 2:39:30 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Barbara Scott-Brier

**Sent:** Wednesday, October 4, 2023 2:44 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Maureen O'Neal

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 2:49:33 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Michael Noack

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Miriam Landman

**From:** [Paul Robillard \(pdr@worldwaterwatch.org\) Sent You a Personal Message](mailto:pdr@worldwaterwatch.org)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 2:53:45 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Offsets for CO2 emissions from industry and transportation sources is essentially "greenwashing". We must mitigate CO2 emissions directly by adopting renewable energy sources and transportation systems as well as adoption of sustainable lifestyles by everyone. The climate crisis is an inter-generational problem. Leaving the planet in an uninhabitable state for our children and grandchildren is not an option. CO2 offsets are ineffective, outrageously expensive and only provide a diversion from effective climate actions.

Paul D Robillard, World Water Watch

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Paul Robillard

**Sent:** Wednesday, October 4, 2023 2:55 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Richard Musser

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Kathleen Pavlick

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 3:15:52 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

**Sent:** Wednesday, October 4, 2023 3:25 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Lisa Caine

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 3:43:59 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dustin Kearns

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 3:47:13 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Polluters instead want to win offsets for so-called "renewable" natural gas and dirty hydrogen projects sited outside of Oregon, a move that would violate commitments made when the program was created, and with other stakeholders in the CPP process.

And, of course, result in more investments in unsustainable fossil fuels.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking "if done well" will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Deb Carey

---

You don't often get email from vicearoy@gmail.com. [Learn why this is important](#)

Thanks for your work. Often in the last summer and autumn, I feel trapped in my home because of poor air quality secondary to wildfires. It never used to be this way and it's happening all over the world. It's clear that we are in an environmental/climate emergency and only a quick reduction of greenhouse gas emissions can save us. It's your job to make this happen.

I have lived in Oregon for 35 years and have two sons and one grandson. I have grave concern for their future.

Fossil fuel corporations are promising one thing and doing another. They are undermining attempted regulation while increasing their output and profits. Locally, Northwest Natural promises to reduce emissions with bio-methane. Over the last three years, their emissions have increased 9%. We know that natural gas is much worse than coal for our climate.

Please do not allow any weakening of the Oregon Climate Protection Plan.

Sincerely,  
Charles Areford

**From:** William M. Musser IV <campaigns@good.do>  
**Sent:** Wednesday, October 4, 2023 3:57 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
William M. Musser IV

**Date:** Wednesday, October 4, 2023 3:57:43 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

It is imperative that Oregon act now to make certain that the guidelines for how we view our natural resources and how we protect and preserve our environment are done with long-term vision. Short-term strategies will not create the foundation that we can depend upon for future generations, especially in light of dramatic changes in climate and the impacts of those changes on the environment and the quality of life in our communities. Corporations do not bear the brunt of the consequences when economic development is valued over the health of our ecosystems and communities. Future generations will be the ones who celebrate or mourn how the priorities were set.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Lynn Cardiff  
Salem, Oregon, 97301, United States

**From:** [LeAnn Pinniger Magee \(lepermag@gmail.com\) Sent You a Personal Message](mailto:lepermag@gmail.com)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 4:40:36 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

I witnessed the incredible lack of conviction by the DEQ in the Deep South, where adherence to state policies was often lax, and the meaning of "environmental quality" was lost. Please prove that Oregon can maintain our credibility and determination as a green, ecologically sound, environment. Do your jobs, DEQ!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking "if done well" will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

LeAnn Pinniger Magee

**Sent:** Wednesday, October 4, 2023 5:08 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Linda Perrine

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Daniel Smith

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 5:30:55 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Mary Lyda

**From:** Jonathan Lee <campaigns@good.do>  
**Sent:** Wednesday, October 4, 2023 5:53 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Jonathan Lee

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Ann Nowicki

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Judy Wilcox

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

The handwriting is on the wall. In fact, it's all over all the walls heading out the door and down the sidewalk to where we can all see with our own eyes the damage that has been done to our state. Our forests are suffering in the heat, our rivers are more polluted than they were in the 70s, fewer and fewer salmon make it up the rivers to spawn...but wait! We all know all this already. The question is, do we have the will to see that fossil fuel industries in Oregon do not slide through loopholes.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Dena Turner

**From:** Betty Shelley <campaigns@good.do>  
**Sent:** Wednesday, October 4, 2023 6:58 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Betty Shelley

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 7:06:23 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Edwin W Moore IV  
6550 B St  
Springfield, OR 97478

**Sent:** Wednesday, October 4, 2023 7:09 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Dana L Petre-Miller  
Petre-Miller

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 4, 2023 8:09:40 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Heather Dale  
26761 SW 45th Dr  
Wilsonville, OR 97070

**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ well knows, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the Climate Protection Program which is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon. This is unacceptable.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Derek D. Severson

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

George Snipes

**Date:** Thursday, October 5, 2023 1:50:34 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Dear Oregon Department of Environmental Quality - 2023 CCP,

I am a retired Professional Engineer with a lifetime of involvement with every aspect of river basin management and restoration, achieving remarkable results in wildlife-friendly river restoration on West Coast streams. I have also been a University Professor in London, specializing in sustainability issues with special reference to rivers, Climate change is an existential threat to humankind as well as wildlife, which is suffering from savagely high extinction rates, Oregon stands at a crossroads; sticking to the CPP may stave off greatly worsening conditions (wildfire, floods, landslides etc) but weakening this resolve to actually tackle climate change will be disastrous.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**From:** Jim Lussier <campaigns@good.do>  
**Sent:** Thursday, October 5, 2023 9:15 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Jim Lussier

Dear Oregon Department of Environmental Quality - 2023 CCP,

Please stand up to oil and gas. Finally the time has come that we acknowledge that self-regulation does not work and that the oil and gas industry need to be dealt with in terms of the lying and deception over many decades. Their focus on profit is hurt every country in the world and the planet itself. We need to have government control of oil and gas because they can't do an acceptable job themselves. Please do not let this status quo go on any longer.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

John Altshuler  
2910 Grand Cayman Dr,

**Sent:** Thursday, October 5, 2023 10:04 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Joan Torok

**From:** Andrew Apter <campaigns@good.do>  
**Sent:** Thursday, October 5, 2023 10:06 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Please reconsider your proposed climate rules

Dear DEQ:

I appreciate your interest in public input on the proposed 2023 climate rules. Oregon's Climate Protection Program addresses the critical policies which set a minimum standard for meeting the state's climate goals.

Success in fulfilling the absolute need to confront the dire warming of the climate is complex. DEQ's role is especially important. The rules DEQ is proposing seriously undermine the state's ability to achieve its carefully crafted climate reduction goals. Most egregiously, DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

Given how clearly the proposed rules fail to address the state's climate goals, I am hoping you will make the following adjustments. :

- 1) Limit the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallow hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Your role in ensuring a healthy future is vital. Please upgrade your rules in a manner that is consistent with the state's expressed goals.

Thank you for your time and attention,  
Andrew Apter

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ **not** to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because new opportunities for development across will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will **not** include geographic limits for decarbonized fuels like renewable natural gas and **will** allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

As an Oregonian and a manager of a small business in Oregon that provides jobs to 65+ Oregon families, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I'm also very concerned that we will lose our ability to stay competitive in locations that can be accessed by other states (about 60% of our business.) I urge DEQ **not** to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because new opportunities for development across will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will **not** include geographic limits for decarbonized fuels like renewable natural gas and **will** allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

**Date:** Thursday, October 5, 2023 10:53:49 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Natural gas is a fossil fuel. While the gas itself may or may not be seriously harming the environment, the method of getting natural gas from the ground (Fracking) seriously destroys areas surrounding fracking sites, while method of transporting it is equally dangerous. Further, removing natural gas from the ground is disruptive to the earth's crust and we've witnessed earthquakes in areas that are fracked where earthquakes were never occurring before.

We must continue to expand natural alternatives to energy procurement. There are now very small wind generators that can sit on rooftops, or along freeways to collect air movement and generate power. We should be looking into those alternative forms of energy and perhaps offering rebates on single family sized wind generators.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

You don't often get email from lotilivo@gmail.com. [Learn why this is important](#)

The subject line is a trick question:

Which of the 3 basic EV drivetrains offers most potential to reduce fuel/energy consumption, emissions AND insane traffic?

Your answer here \_\_\_ \_\_\_ \_\_\_

**WRONG!!**

The correct answer is PHEV plug-in hybrid.

BEV best for lightweight and short-distance needs.

Combustible hydrogen PHEV+H stores at lower pressure in smaller, safer tanks and can deliver more than twice the equivalent MPG possible with fuel cell tech.

Why is this subject important you ask?

Use the word "equitable" to describe resource distribution.

ONE huge BEV freight truck battery packs (5 in 10 years).

Or as many as "500" household PHEVs (1 pack 10 years).

PHEV also better for big rigs. 1 BEV pack delivers 150k-200k miles.

The same pack divided into 5 PHEV packs also deliver 150k-200k miles to collectively deliver ONE MILLION miles vs 200k miles with BEV.

Divest Daimler ??

I'd like to get a response to my assertion that EV tech is wrongly misguided. My assertion is PHEV tech offers most potential for future EV fleets. PHEV is actually indispensable. The fossil fuel question {BEV vs PHEV} Which one reduces fuel consumption most? Correct answer: PHEV (even on fossil fuels).

Dear Oregon Department of Environmental Quality - 2023 CCP,

I believe that we are all responsible for the world we are passing on to those coming after us, our children and grandchildren. The heat of this past summer and the smoke of this summer's forest fires is looking like one of our main legacies; we must do more than we are to reduce the carbon we are putting into our atmosphere. Please stop the offsets allowed to the oil and gas industry.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

**Subject:** Climate 2023 Proposed Rulemaking - LWVOR - Comments

You don't often get email from [lwvor@lwvor.org](mailto:lwvor@lwvor.org). [Learn why this is important](#)

Hello,

Please see attached testimony sent from Claudia Keith, Climate Emergency Coordinator, and Arlene

Sherrett, Climate Emergency Portfolio, on behalf of the League of Women Voters of Oregon.

Best regards,

Staff

League of Women Voters of Oregon

*Phone:* [503-581-5722](tel:503-581-5722); *Email:* [lwvor@lwvor.org](mailto:lwvor@lwvor.org); *Web:* [www.lwvor.org](http://www.lwvor.org)

**From:** Tess Wobbe <campaigns@good.do>  
**Sent:** Thursday, October 5, 2023 2:05 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Tess Wobbe

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Thursday, October 5, 2023 2:07:18 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Stop oil and gas trickery

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Scott Penzarella

**Subject:** Rulemaking Comment: Please Keep Costs Down  
**Date:** Thursday, October 5, 2023 5:02:20 PM

---

You don't often get email from jon.jensen@arauco.com. [Learn why this is important](#)

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ **not** to further increase costs by imposing geographic limitations on renewable natural gas (RNG). Restricting opportunities for development will decrease supply and drive up costs.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will **not** include geographic limits for decarbonized fuels like renewable natural gas and **will** allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

Jon Jensen

As a rural, north coast Oregon resident, I am very concerned about climate change's impacts on Oregonians, and I urge DEQ to make rules as rigorous as possible to assure much lower carbon emissions over time in alignment with best available science.

Please:

- Do not weaken the Best Available Emissions Reduction rules and instead adopt rules that put all polluting industries on a downward trajectory of emissions;
- Do not allow gas utilities to import unlimited Renewable Natural Gas from out of state to offset emissions;
- Do not allow gas utilities to use hydrogen unless the hydrogen is produced with electricity generated by renewable fuels; and
- Adopt rules consistent with the CPP as approved by the Environmental Quality Commission.

Thank you for helping to ensure that our children and grandchildren do not have a worse climate crisis situation. It is our fault that we are in the position we are today. We have a responsibility to do better.

You don't often get email from [eriesterer@brucepac.com](mailto:eriesterer@brucepac.com). [Learn why this is important](#)

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ **not** to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because new opportunities for development across will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will **not** include geographic limits for decarbonized fuels like renewable natural gas and **will** allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

**Elliot J. Riesterer, CPA**

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, October 6, 2023 10:22:15 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Judy Skopek

**From:** Nancy Mauter <campaigns@good.do>  
**Sent:** Friday, October 6, 2023 10:32 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

The Climate Protection Program (CPP), rulemaking– if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

The public supports Oregon's climate pollution reduction goals and I am writing to request that:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

It is essential that Oregon stays on track to achieve our climate goals. Otherwise, let's just throw in the towel and stay in denial till we have no choices to curb the climate crisis.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Nancy Mauter

Dear Oregon Department of Environmental Quality - 2023 CCP,

Please do the right thing for our planet.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Priscilla Connolly

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Way to be doing all we can to stop subsidizing pollution and carbon and other greenhouse gas emissions during this climate crisis.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and

Dear Oregon Department of Environmental Quality - 2023 CCP,

I have a small grandson I want to grow up in a safe environment. That means we must transition and polluters must be held accountable to stop and restore the damage they have caused. Oil and gas companies have known for generations that they are contributing to climate change and pollution and have done nothing to change and a lot to increase the problem. "Drill baby drill" cannot stand!

Thank you

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

Dear Oregon Department of Environmental Quality - 2023 CCP,

Our community and its constituents in Oregon deserve better. Please consider amending the DEQ ruling as outlined below. Our children's future is at stake.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dylan Plummer

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, October 6, 2023 12:36:20 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

**Subject:** Rulemaking Comment: Please Keep Costs Down  
**Date:** Friday, October 6, 2023 1:04:58 PM

---

You don't often get email from [sclippell@cascademeatsinc.com](mailto:sclippell@cascademeatsinc.com). [Learn why this is important](#)

To whom it may concern;

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ **not** to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because new opportunities for development across will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will **not** include geographic limits for decarbonized fuels like renewable natural gas and **will** allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

*Sally Clippell*

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, October 6, 2023 1:40:42 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Amber Elmwood

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, October 6, 2023 3:28:45 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

DUH!!!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Marcel Liberge

Dear Department of Environmental Quality,

Sent from my iPhone

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and

2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP’s Best Available Emissions Reduction program.

Sincerely,

Kim Stein

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
darcy miller

Dear Oregon Department of Environmental Quality - 2023 CCP,

It is time to get real about protecting our environment. There are so many excuses to delay taking firm action, but there always will be. Our planet is on the brink of collapse if we don't take action now to protect it. Nature and the people who live here deserve clean air, pure water, and uncontaminated food. Let's make this happen now!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Allyson Smith

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Derek Benedict  
709 212th Pl SW  
Lynnwood, WA 98036

You don't often get email from [bbenbaruch@ashlandhome.net](mailto:bbenbaruch@ashlandhome.net). [Learn why this is important](#)

Dear Chair George, Vice Chair Baraso, members of the Commission,

We are facing an existential crisis because of climate change. The rules you make will have consequences for the climate and and consequently for the well-being of everyone in Oregon. Minimally, the DEQ must ensure the Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities.

If done well, your rules will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. If done poorly, your decisions will negatively impact our lives and well-being.

Given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

- I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.
- Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon.
- By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.
- I therefore strongly urge DEQ to amend the proposed rules by:
  - Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
  - Strengthening emissions reduction requirements for new or expanded large

stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

- I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits—ensuring that they benefit Oregon communities, and are not exported out of state.

Sincerely,

**Benjamin Ben-Baruch**

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Imogen Taylor  
515 N Holland St  
Portland, OR 97217

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Friday, October 6, 2023 10:12:30 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Our grandchildren need to be able to live on an earth free of the pollution we live with.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Joe Rawlings

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Derek Gendvil  
9030 W Sahara Ave PMB 360  
Las Vegas, NV 89117

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**I SUPPORT THE CPP!!! THE DEQ NEEDS TO DO EXACTLY WHAT THEIR NAME SAYS - ENVIRONMENTAL QUALITY!! KEEP OUR ENVIRONMENT FROM BECOMING MORE POLLUTED; REDUCE EMISSIONS, MINIMIZE COSTS TO THE PUBLIC AND DON'T DIVERT MONEY FROM THE CCI PROGRAM!!!!!!**

Sincerely,  
Susan Smith

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Ann Reece

Dear Nicole Singh,

As an Oregonian, I am extremely concerned that we are putting all of our future energy needs into one basket. We cannot drive natural gas out of the picture I making it more and more expensive to use. Just as we cannot rely on electric cars for a future transportation needs, we must have the resources available and affordable for the continued growth and prospering of our state and country. Please don't drive out natural gas from the energy/heating tools that we have available.

I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

I also do not believe fossil fuel usage should be eliminated. There is a balance that should be achieved with a mixture of all the different types of energy.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Dear Nicole Singh,

It seems that government officials learn nothing from their constituents or from other officials. Have you not noticed how many taxpayers are fleeing the West Coast because of the exorbitant taxes and surcharges and hidden upcharges that are happening? Please consider your families and retirees as you promote more and more expensive programs. This one on your plate now is the most expensive in the nation. Please think about ordinary people with ordinary incomes. We already have good programs that are costing us plenty.

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Dear Nicole Singh,

As a long-time Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program in its entirety. It does very little to help the environment in the context of vast pollution coming from China and India, but it does unfairly place a burden on senior citizens.

I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.

- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Cliff Stephens

Dear Sir, I would like to register my concern regarding any decrease in regulations for emissions in our current climate crisis problem. We are speaking of a huge crisis in our world with little time to reverse things. Therefore I would like to request:

- Restricting biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.
- Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Sincerely,  
Diane Williams Engelhardt

Dear Oregon Department of Environmental Quality - 2023 CCP,

Time to focus on our environmental and human health

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Maggie Shreve

DEQ should not impose geographic limits for renewable natural gas projects. This seems short sighted. Replacing gas with electricity which also uses fossil fuels to produce is not efficient nor solve tge problem.

Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and

Michael Orendurff  
432 Parkside Drive  
Ashland, Oregon  
97520

would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Marvin Owen

Dear Nicole Singh,

I've lived in Lake Oswego for 35 years and have had numerous situations in which having a gas stove and a gas fireplace saved us from freezing!

There have been multiple times power was lost and just 2 years ago we were without power for 9 days while living within the city limits. Had it not been for natural gas being available for some heat (one room) and cooking, we would have been forced to leave our house for at least a week. As it was, our room temperatures dipped to below 45 degrees. Your restrictions on gas appliances violates every common sense plan for multiple back-ups for emergencies. I honestly don't know why you are pushing the illogical rules you have on your agenda.

I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

OR

Sincerely,

Dear Nicole Singh,

Dear Sirs: I use my gas stove for many purposes that could not be achieved with electric stoves only. Several of my children have electric stoves and they see how much more versatile and safe and useful natural gas is. We all wonder why you have this "need" to create big roadblocks to the use of gas! It doesn't make sense what you are proposing.

I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Dear Oregon Department of Environmental Quality - 2023 CCP,

Do not allow ?renewable offset loopholes? that foster industries paying to pollute. We have a short timeframe to substantially reduce emissions and so-called renewables and industry self-reporting are both incredibly problematic on so many levels.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon?s cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ?s current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of ?book and claim? accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP?s Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase my cost of living by imposing ridiculous geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians. You do not represent me appropriately.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change. Do not price me out of Oregon State.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Saturday, October 7, 2023 9:02:00 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

No more offsets for polluters!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Thomas Campbell-Schmitt

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

Those arbitrary geographic boundaries don't make sense and will likely increase costs for Oregonians, would be like excluding wind and solar resources from outside of Oregon (preventing meeting clean electricity goals) and finally would limit carbon reduction opportunities.

**Date:** Saturday, October 7, 2023 10:20:47 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

To Decision-makers at DEQ:

I am very concerned about the Oregon State government over-reacting to the climate change issue & pursuing solutions that are over-reaching and far too costly. I am a strong supporter of being good stewards of the environment, and I do my best to live consistently with that. I want my government to do that as well.

However, I believe we need to ensure that when we are addressing issues such as the effects of climate change, we do not pursue solutions that are worse overall than the problem. In my opinion government should NOT be outlawing natural gas for residential or commercial use. It should also NOT be outlawing vehicles that run on petroleum products. Incentives are one thing, making these things illegal is another. I also understand that there are many other facets of this issue and many solutions in play. It is not a simple issue.

We need to ensure that the costs of the proposed solutions are sustainable for ALL Oregonians, especially those in lower income brackets. We need to ensure that viable, cost-effective alternatives are developed and available to ALL Oregonians before we mandate switching to those alternatives. We need to ensure we are not jeopardizing the health of the state's budget & that those entrusted with funding for the chosen solutions are accountable in meaningful, verifiable ways for the spending & results. And we need to find ways to pursue these goals without increasing the tax burden on individuals or business.

Thank you for considering my thoughts.

Sincerely,

Dave Kost

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
M Gimbal

## What is your response to this concern?

Compared to other climate programs, **DEQ's price per ton of CO2 is the most expensive in North America.** And costs will increase over time as requirements to reduce emissions become more stringent. DEQ should leverage the lowest-cost and most available resources for Oregonians and **not** include geographic limits for renewable natural gas projects.

## And this:

For the past several years, NW Natural has presented feedback and serious concerns to DEQ; those concerns about quantifiably reducing emissions have not yet been addressed. Every dollar spent needs to be invested in effective solutions to lower emissions with transparency and accountability.

It seems to me the State of Oregon is ramming through their own agenda (wanting to be 'a leader'), without caring about the average person who needs to heat their house affordably and effectively. You include trendy phrases such as environmental justice. You say that your "co-benefits and equity assessment found that *overall*, the Climate Protection Program *could* result in positive co-benefits and equity benefits. The design and *implementation of the Community Climate Investment funds was a key driver of these results.*" What happens if the Community Climate Investment program doesn't happen? And you even hedge by saying that the Program *could* result in positive benefits, so it's not even certain. That seems to be gambling with taxpayer money.

Regarding your estimates for implementation costs to the State, you make it sound as if one or two employees *may* have to spend a few hours on dealing with this program, which is undoubtedly an understatement. Your dept has already spent untold manhours designing, developing and presenting this plan, and you *will* require staff to implement and maintain this program -- all funded by taxpayers.

You say you "evaluated whether the proposed rule would have an effect on the development cost of a 6,000 SF parcel and construction of a 1,200 SF detached, single-family dwelling on that parcel. DEQ determined the proposed rule amendments will have no impact on the supply of housing or land for residential development. The proposed rule amendments will not impact the cost of labor or administration related to such development." That addresses new construction only. What about the vast majority of housing that already exists, which *will* be impacted by your new rules? You would prefer that those houses convert to something other than natural gas heating, but many people cannot afford to do that.

You also say that "DEQ recognizes that any proposed rule amendment that might increase compliance costs for individual fuel suppliers regulated by these programs could be passed on to customers. DEQ recognizes that some individual fuel suppliers may experience changes in the number of compliance instruments received from DEQ and this may increase costs for customers of individual fuel suppliers. This would be of additional concern for environmental justice communities that have fewer options to transition to other fuel sources and who spend a larger portion of their household budgets on energy and fuels." **We all know that any and all compliance costs to for-profit companies will always be passed on to**

consumers, yet you gloss over that.

And yes, I realize that my comments to you will be ignored.

Alice Duff  
Portland

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. Our climate has been changing since the earth was created and all of this bogus climate change protection is just hurting people. The major so called climate change models left out clouds and rain in their predictions. STOP, just STOP ALL of the climate change rules!

I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.

- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Martha Neuringer

As a born and raised Oregonian, I want to strongly object to the Oregon DEQ's proposed illegal program to remove our gas powered cars and small engines, diesel engines, natural gas stoves, etc.

This "climate change" hoax is just that and you know it! All your alternative fuels will not meet the needs of Oregonians, leaving us vulnerable to cold, heat and costing us untold amounts of money to survive.

As long as China and India keeps pumping out their emissions it won't matter what we do. Our food supplies (plants) need CO2 to grow, you cut that out = no food! Studies (real scientific studies, not your made-up ones) have shown this program will make no difference even if we go to zero emissions .

Having a committee of climate activists from around the state will only present one side of this issue, which is a Left-wing Democrat project. What will be the cost to Oregon residents to be forced switch to your "alternative" sources? Who is going to pay for me to switch my gas stove, my gas clothes dryer, my only heat source - gas fireplace insert? How about my cars, lawnmower, motorcycles?? What accommodations will be made for disposal of all these items? Will it be like the dead windmills, burying them in landfills? That's really good for the environment!

Again, I totally object to your total emissions ban plan and hope you will look long and hard at this proposed plan and be honest with Oregonians about the total cost and detriment to our people and state!!

Sincerely,

Terry Harris

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective. I am very opposed to any cap and trade system as this will also do nothing to reduce carbon emissions, it only disguises reported emissions to the public and raises cost.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals. Natural gas is our best option to use until a more consistent, reliable, sustainable, and truly environmentally conscious energy source can be attained.

- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Loren Beprestis

Dear Nicole Singh,

We can't afford our utilities now as we are retired and on a fixed income. With 17% increases in groceries, 27% increases in electric rates and 50+% increases in gasoline the past 2 years senior citizens are being asked to sacrifice our medicines and eat less just to keep from losing our homes.

Stop hurting the citizens of Oregon with these needless mandates that accomplish virtually nothing but cost us enormously in our ability to have even a modest life.

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Help Oregon stay on track to meet its climate change goals. Please strengthen proposed rules by:

- Restricting biomethane (aka renewable natural gas and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.
- Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

Dear Nicole Singh,

I am submitting this, but I am going to be perfectly honest. I am so sick of the green agenda because it is a lie. Where does the electricity for electric cars come from? That would be natural gas and coal. So, is an electric car really electric? The answer is no. This whole climate thing is beyond ridiculous. First we were told we were going to freeze to death in the 80s, never happened. Now we are told we're going to boil to death, it also will not happen. Stop the madness and let the gas company alone please and stop jacking up prices as you try to influence the state in this what you call a clean energy direction which is not a clean energy direction at all. Global warming is one of the biggest lies ever told in history and it's disgusting.

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Karen Grimes

Dear Nicole Singh,

I am so sick of hearing about "Climate Change" because this is just a normal happening in the world. Granted China has been the number one polluter in the entire world as well as India. Stop this Green New Deal! It is just costing America too much money and costing jobs. We need to get back to being energy independent. Stop building the Wind Turbines! They are destroying wildlife and agriculture. That's all I have to say at the moment. Just sick and tired of hearing AOC and the swamp talk about Green Energy!

Sincerely,  
Kathleen Randall

**Date:** Saturday, October 7, 2023 2:45:01 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

If we don't work together to solve our environmental problems, you and your family will suffer the consequences right along with the rest of us. Let's work together on this.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dear Nicole Singh,

As a 45-year resident of Oregon and struggling business owner, I have become increasingly alarmed by the rapid rise in taxes, fees, and other expenses related to the state's mandates for "climate protection."

Please do not further increase our financial burden by imposing geographic limitations on renewable natural gas. Even if this arbitrary rule actually could produce any meaningful reduction in carbon emissions (highly doubtful), it makes no sense from a cost/benefit standpoint. Instead of achieving "climate sustainability", rules like this make living and doing business in Oregon unsustainable.

I urge DEQ to carefully review the costs vs. benefits of any new mandates, recognize the importance of keeping costs down for struggling Oregonians, and focus your program on quantifiable solutions to address climate change.

Dear Oregon Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Sincerely – Gary and Janice Sumrak, 2485 Pinebrook Circle, Medford, OR 97504

**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities my grandchildren will inherit.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits— ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Diane Chavez

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.

Case in point: Denmark is a great example. Country-wide development in turning organic waste streams into a climate solution has allowed Denmark to achieve 40% of its total gas use in homes and businesses as RNG, with their national goal of 100% RNG by 2030 – completely displacing fossil fuel use.

- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and promote use of oregon's agricultural waste into RNG, becoming the model for other states.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Saturday, October 7, 2023 5:27:18 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change. First of all let's call this what really has to do with. It's a money grab. Take a look what Oregon and Washington is are doing to their citizens. You are taking hard earned money and putting it into programs that have nothing to do with climate. Natural Gas is one of the cleanest fuels known to man, and you're trying outlaw it. That is rediculas! Build more Natural Gas fired power plants. Don't tare down anymore Clean Coal fired Power Plants. And for crying out loud, build some new Nuclear Power Plants. Let's put Nuclear Power Plants on the upcoming ballet and let the citizens be heard. That would be the best solution to your so called Climate Change Religion. Do Not increase taxes to pay for anymore of this insanity.

Sincerely,  
Bronner Smith

- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Lark Valdini

**Date:** Sunday, October 8, 2023 8:21:44 AM

---

Dear Nicole Singh,

Northwest Natural Gas has done the work and supplied you with a plan PROVEN to accomplish lowered emissions.

You are ignoring that? - and marching on to raise rates yet again?

We lower income citizens have had and still have NO protection against your department raising rates to what is already a significant burden on our finances.

We live very frugally (and spend responsibly) on a meager income obtained through honest hard labor!!

We plead with you to rethink, further research ideas and not just pull more money from our far too stretched budget as an easy answer.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Further, even if you accept the validity of the climate models predicting doom, your proposed solutions will have zero effect.

It is axiomatic that any policy or law that cannot accomplish its stated objective is bad and should be opposed.

Your proposal will drive up energy costs at a time when inflation is squeezing working people's budgets for no benefit. It will make everyone worse off for no benefit.

Do not pass foolish, expensive regulation to appeal to the fetishes of out of touch, wealthy elites.

Serve the people.

Sincerely,  
Jon Rivoli

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dear Oregon Department of Environmental Quality - 2023 CCP,

Carbon offsets are not a solution to the catastrophe that is occurring. They are a shell game that just obscures the damage that is happening. We need real change now. 85 degrees in Portland in October isn't OK. Midsummer 116 degree heat domes aren't OK. Massive fires like the Eagle Creek fire that I witnessed while driving through the Columbia Gorge a few years ago aren't OK. Carbon offsets are a failed idea that corporations are using to cover up their damaging activities. We are in a climate emergency and it's time to act like it.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of ?book and claim? accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

**Sent:** Sunday, October 8, 2023 12:22 PM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Audrey DeKam

Rule Making Committee,  
October 8, 2023

I live in Eugene and we have had some very expensive run-ins with NW Natural Gas in the last few years, as we try to electrify our economy. They stonewalled the City for years, and then sabotaged our local process.

I see NW Natural Gas is one of the 12 “regulated” industrial corporations on your 14 member committee, with only two public interest members. How does this represent the interests of the citizens of Oregon? It was the public interest groups who worked to pass the CPP! These “regulated” industries fought the CPP the whole way – why should they now be in a position to decide how it works????

Here are some suggestions for you:

Your current concessions to regulated industries allow out-of-state RNG bio-methane investments and could enable the expansion of new large industrial emitters, defeating the goals of the Climate Protection Plan (CPP).

Also, strengthen the emissions reduction requirements for new or expanded stationary source facilities in Oregon under the BAER Act.

Also, strengthen requirements by restricting bio-methane used for CPP compliance to that which would produce direct benefits to Oregonians.

I'm very concerned that this type of mostly out of state investment would actually divert money from the Community Climate Investment fund, created specifically to focus on benefits to Oregonians.

Your rule-making is vital to ensure this program stays on track to achieve its stated climate, public health, and economic goals. You are in a crucial role to make sure this actually happens.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Summer Boslaugh

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Sunday, October 8, 2023 2:13:25 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,

It essential that the Climate Protection Program , CPP, be adopted so that it meets the standards of EO 20-04 be met. Any effort to delete the intent of 20-04 should be stopped. Please do not allow hydrogen to be produced unless it is produced with fuels developed from renewable fuels. Please do not continue to deploy any use of more fossil fuels.

Dear Nicole Singh,

I am writing regarding changes to the state's Climate Protection measures affecting natural gas. According to the IPCC's latest assessment, if we shut down ALL sources of CO2 in the world today it would make 0.01 deg C difference in 2100. That being the case, since in comparison to India and China's emissions ,which have increased 22% since the Paris accords and account for 37% of worlds emissions, any attempt to cut Oregon's 0.009% of the worlds emissions is just a tax on the poor of Oregon to enrich environmental rent seekers. BTW, without CO2 we'd all die.

Dear Nicole Singh,

As an Oregonian, I'm concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. This will also greatly negatively effect poor and marginalized Oregonians by increasing the energy costs to a segment of the population least able to afford those increases. Please consider the trade offs before imposing this rule.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.

- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Sunday, October 8, 2023 3:48:41 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

My wife and I oppose continuation of "offsets" used by dirty fuel users.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dear Oregon Department of Environmental Quality - 2023 CCP,

We have a chance to reverse the worst aspects of climate change only if we act now. We cannot waste time with useless or counterproductive actions. Paying to pollute is harmful and costs us all.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Jeff Wiwatowski

To Whom It May Concern:

Please make the CPP as strong as possible. Anyone paying attention realizes how precarious our environment is, even if we do have the occasional period when things seems somewhat normal.

I have lived on my small woodlot for 20 years and have seen the decline in forest health on my property and our public and private forestlands. If we do not turn this decline around we're in for a very hard ride.

We should be vigorously pursuing all opportunities to slow the rate of global warming. As the Department of Environmental Quality, please don't assist those who are currently profiting from our energy crisis by weakening the Climate Protection Plan. If this happens, your department will have to be renamed the DNEQ...the Department of Non Environmental Quality.

Sincerely, A distressed citizen,  
Gail Cordell  
Oregon City OR

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
John Giacoppe

RE: Comments on CPP proposed rules

Thank you for requesting that members of the public comment on the proposed rules for the Climate Protection Plan before you finalize them. The public has a huge stake in protecting the climate as so many of us feel the greatest effects when it is not protected. I am one of those people, and I have children, so am even more concerned about their future. Oregon should pull out all the stops to make their Climate Protection Program the best in the country. I want to be proud that I live here.

I am very concerned that you seem to have so many members on the Rulemaking Advisory Committee that represent financial interests tied to the regulated industries that the rule-making affects. It seems like too much of a conflict, so I hope you will listen to the public comments more than to the opinions of conflicted commenters and advisors. I am a resident who is very concerned about the lack of enough action on climate to stop the worst, and compounding effects of rapid climate change.

One thing I have heard is that you are allowing credits, similar to RECs in CA, for investments by a company like Northwest Natural Gas in biomethane projects outside of Oregon. That is really a mistake, as then this company does not have to do as much to switch out of natural gas to something less damaging to the atmosphere, like geothermal. Plus, with this way of giving credit, the benefits go out of state. We need to move fast towards stopping the use of natural gas here because methane that is released throughout its life cycle, from coming out of the ground through fracking, to its final use, is 80 times more powerful, (traps 80 times more heat than carbon dioxide), as a GHG in the first 20 years it is in the atmosphere. We have so little time to stop the tipping points; it may already be too late.

And I have heard you are making rules regarding the use of hydrogen, promoting its use as possibly a more sustainable source of energy. I do not believe it is much more than a distraction right now, but there may be some hydrogen that is created in a way that is green enough that it might be worth looking at. But your regulations must be very precise on what the definition of “green” is.

Gas companies all over the country are involved in strategies – worked out by a common lobbying group – to water down climate action regarding their current product. Please let the public, who overwhelmingly want the Climate Protection Program and want it to be very strong, see that you have not allowed it to be weakened by conflicted financial interests.

Thank you for reading this and giving me a chance to say what I am thinking about the Climate Protection Plan rule-making process.

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Monday, October 9, 2023 9:19:39 AM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Michael Larsen

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Aliya Smyth  
7244 SE Insley St  
Portland, OR 97206

Dear Climate DEQ,

It is disgusting to me that you would limit affordable energy for the average Oregonian. When we think about finances we think about heating and running our homes. The whole carbon neutral thing is ridiculous when you are just trying to care for your family. It means less than nothing when we can't afford to heat our home in the winter due to extremely high energy costs.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Build nuclear before de-carbonizing energy.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Simon Brown

Dear Climate DEQ,

Dear DEQ,

I respectfully ask that the agency remove the geographic limitation on Renewable Natural Gas (RNG) and preserve all decarbonization options to help keep energy costs down. I appreciate the policy and political objectives the agency is tasked with meeting, but this restriction will only drive-up costs for consumers and create a disincentive to further investments in RNG production and delivery.

The natural gas system is a reliable and safe energy network that helps balance loads and provides energy for thousands of Oregon homeowners and businesses. The natural system is particularly important on days of peak demand, both in the summer and winter, when solar and wind resources are strained, or at times unavailable (such as at night and during weather systems with little or no wind).

Renewable Natural Gas shows great promise in helping decarbonize the energy system while making use of waste methane that would otherwise be vented. And it provides a reliable backbone of system resilience that wind and solar (and batteries) cannot yet provide.

Placing geographic limitations on RNG makes no practical or policy sense given there are no similar requirements for electrons generated from wind and solar.

Thank you for your consideration,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Dear Climate DEQ,

Eliminating natural gas heat moves generation of heat from a 90%+ efficient process to a 40% efficient process and you are actually generating more carbon. You are raising the cost of energy, making it less convenient, hurting the environment more. You don't have the knowledge to make these decisions and you are listening to "experts" that are nefarious or incompetent.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Dear Climate DEQ,

We upgraded our furnace last year to 96% efficient .I have had electric heat it doesn't heat or keep the house warm as Natural Gas or wood dose .We're to old to mess with wood and can't afford to switch to inefficient electric.We are also on a low income and the prices are high enough.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

Dear Climate DEQ,

I have enjoyed using natural gas as my preferred choice of cooking and heating for over 45 years. It has not harmed my health nor the health of my 5 children as some liberals try to assert when trying to get rid of natural gas. I appreciate having a choice, and I'm very concerned about having my choice taken away. Please keep my energy costs low and preserve my FREEDOM to use natural gas at an affordable rate.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

LARK SAURMAN

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

October 9, 2023

To: Department of Environmental Quality,

Subject: Climate Protection Plan Comments

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As a citizen of 73 years, I know that this rulemaking will have far-reaching consequences for the climate and communities in Oregon and will serve as a model for other states to use.

The words, guidance and direction given in the Climate Protection Program (CPP), if very clear and done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments and would enable the expansion of new large industrial emitters with the potential to emit huge and unregulated emissions that would adversely affect our climate and air pollution in Oregon.

I therefore strongly urge DEQ to amend the proposed rules by:

<!--[if !supportLists]-->

1. Making sure large industrial emitters are held accountable for their significant climate pollution. As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon.
2. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.
3. Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only

biomethane or hydrogen that is injected into a pipeline within Oregon.

4. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Sincerely, John Livingston 6473 Doral Drive SE, Salem, Oregon 97306

Dear Climate DEQ,

It's obvious the powerful don't care about green energy they just care about control and more power. These type of policies are designed specifically to limit the people's ability to grow in economic power and nothing else. All environmental policies are vicious tyrannical power grabs and everyone knows it. If green energy was important the government would build more dams. The government doesn't want green energy to work because then they would lose their unilateral control over everything.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. **Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Monday, October 9, 2023 12:22:57 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Carol Reese

Dear Climate DEQ,

Gas is an efficient, cost effective resource

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Dan Johnson

I'll keep this simple. Please don't let your reach exceed my grasp. Meaning, that good intentions are not enough, you must pursue good policy. Good policy in this case means a reasonable and affordable roll-out that doesn't bring with it a lot of unintended negative consequences.

A good example of bad policy masquerading as a good intention, is that fool Biden's mandate to replace 50% of all carbon fuel vehicles with EV technology by 2030. That's not even theoretically possible, it's not even a semi-reasonable target. It's pure politics.

The world is not about to burst into flames if we aren't 100% zero emissions in 10 years. Take your time, don't give in to naïve and uninformed hysteria.

Thank you.

I was disappointed to see the unbalanced roster of folks on the Climate 2023 Rulemaking Committee, heavily stacked with industry and few environmental representatives. Given the make-up of the group it is not surprising that the rulings continue to rely on industry guestimate self-reporting through an industry-stacked methodology. The environmental coalition I work with in Portland OR, primarily on the CEI HUB, is very disturbed that DEQ is still utilizing old AP-42 standards written by the oil industry with self-reporting based on the BAER survey. This methodology has been shown to vastly underestimate the amount of emissions by up to 59% and for the Climate Protection Plan to realistically address emission reductions is fully insufficient. Other states utilize preferred newer standards, including EPA methods 204 and 325 to replace company guestimates with actual air quality monitoring DATA, emissions inventories, and health assessments. Oregon should move away from the antiquated BAER system and problematic modeling the rulings are based on.

We are also concerned that DEQ's current proposed Climate 2023 rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

We strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. The CPP already provides significant flexibility/cost constraints for gas utilities to comply. Allowing further flexibility—e.g. use of RTCs—will hinder the transition to non-emitting alternatives and fail to reduce climate/air pollution or deliver health/consumer benefits for environmental justice communities in Oregon.

These projects deliver no direct benefits to Oregonians, while CCIs will provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate

Investment (CCI) program.

The CCI program was developed and informed by many months of engagement with environmental justice communities in Oregon, with the goal of supporting investments that maximize public health, jobs, and cost-saving benefits for these and other communities historically disenfranchised and disproportionately impacted by economic disinvestment, health challenges, and environmental harms.

2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.

3) Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP. Similarly, why exempt airplane fuels and biogenic fuels from certain emission reductions and reporting standards?

4) Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new ACDP or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.

5) Not eliminating the phrase "additional documentation must be available for verification upon request" from a number of the sections. Instead, under 340-15042 biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank-you for your time and consideration. It is imperative for all of our health and safety, given the short timeframe global scientists say we have to reduce emissions in half by 2025, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan instead of fostering business-as-usual or false solutions.

Hello,

I saw the rules that DEQ is making to limit fossil fuel usage and to encourage actual renewable energy (which does NOT include natural gas). Please proceed with all haste. We need to stop using fossil fuels everywhere in order to have a livable planet for our children.

You should also know that I only found out about this because NW Natural (we have a natural gas stove that we have not yet been able to replace) sent us a [piece of greenwashing inviting us to urge you to weaken the rules](#). DO NOT WEAKEN the rules. Make them stronger. We cannot afford to continue to allow companies like NW Natural to keep doing what they've been doing for the past decades. That's how we got in this mess.

I'll stand with you if you take strong action on climate change.

Thank you,

Clint Talbert

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Randy Walker

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

The generic response above expresses my sense of how we should be approaching this supposed climate crisis. I would simply add that none of us are as smart as we think we are and you folks writing these new rules are included in that. It would be wrong to squeeze out existing, plentiful, clean, and affordable sources of energy like natural gas in the name of climate change. I'm not saying we should never move to new forms of energy, but believe strongly that those new sources should only squeeze out the old when they are demonstrated to be cheaper, more plentiful, cleaner, and more efficient. Allowing the market to determine these things is far and away the better choice. Commanding things and disregarding the market raises everyone's costs and hurts those who can least afford it the most. Thank you for your time.

RE: 2023 Climate Rulemaking Comments from Concerned Workers and Business Leaders

I appreciate the opportunity to provide public comments on DEQ's proposed changes to the Greenhouse Gas Reporting Program (Division 215) and the Climate Protection Program (Division 271).

I am concerned about cost impacts to our state's workforce and families. I urge DEQ to help keep costs down by using the most effective and efficient ways to reduce emissions.

- I support decarbonized fuels – like renewable natural gas – as tools for reducing emissions, **including from sources outside of Oregon.**
- Decarbonized fuels provide tangible greenhouse gas savings by displacing the use of more carbon intensive fuels, regardless of the end use location or a pipeline connection to Oregon. Reducing emissions anywhere, within Oregon or otherwise, creates a climate benefit everywhere, including for Oregonians.
- Imposing arbitrary geographic limits on where environmental attributes can be procured harms rather than helps Oregonians. This would be akin to excluding wind and solar resources from outside of Oregon – which would prevent us from meeting our clean electricity goals.
- Limitations will increase compliance costs under the Climate Protection Program. As a business operating in Oregon, we are concerned with efficiency and cost. It is important that real carbon reductions are achieved by the Climate Protection Program in the most cost-effective manner.
- Proven and auditable carbon accounting methods are important. The standard book and claim accounting methodology for decarbonized fuel use from across North America provides a mechanism for proper greenhouse gas accounting under the Greenhouse Gas Reporting Rule while controlling costs.

Please control for costs.

Increasing decarbonized fuel supply decreases costs, which is why we urge DEQ to be consistent with other carbon markets and programs by not arbitrarily including geographic limitation on biomethane and renewable natural gas in the Climate Protection Program and Greenhouse Gas Reporting Rule.

Sincerely,

Patrick Sheehan

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Monday, October 9, 2023 2:56:45 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

The earth belongs to everyone, not just the rich!!!

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Patti Tripp

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs of natural gas, simply because it contains a minuscule amount of carbon. When burned the carbon atom doesn't change, only the complexity of the molecule that it is a part of. Photosynthesis will change it again anyway, so what's the big deal.

Would you please provide the peer reviewed evidence that shows carbon is responsible for supposed "climate change." Also, considering the Earth has been in an Ice Age for thousands of years, how does anyone know what it will be like when it is over. It might be nicer.

Please consider CO<sub>2</sub> as a natural compound and not a pollutant. It forms naturally and is necessary for plants to grow.

The only thing that will be accomplished by further regulation and increased cost of natural gas will be more cold people, and it will be your fault.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Veronica Poklemba

Dear Climate DEQ,

With the increasing unrest in the world do you really believe it is time to increase energy costs.. People are drowning in increase expenses for gas for cars and now you want to go after natural gas, that is an economical was to heat homes. We have an abundance of natural gas it is clean and efficient. We are all worried about climate change but timing is everything and this is not the time to cause more pain to our wallets.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Its very important that we find more sources of clean burning natural gas.  
America does NOT need more regulation, we need more innovation.  
Natural Gas, along with other sources of clean energy like nuclear will drive our economy forward.  
Small Scale Modular Reactors can produce large amounts of hydrogen to power transportation and industry.  
There needs to be fewer regulations, not more.  
The time for American Energy Independence is now!

Thank you for the opportunity to provide comment on DEQ's 2023 climate rule making. As DEQ knows well, this rule making will have far-reaching consequences for the climate and communities in Oregon.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP- a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rule making and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

I strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Randy Wright

I am an Oregonian who supports strong state action to address the climate crisis.

The Best Available Emissions Reduction rules should not put polluting industries on a downward trajectory of emissions. Gas utilities should be prohibited from importing unlimited Renewable Natural Gas from out of state to offset emissions or using hydrogen unless the hydrogen is produced with electricity generated by renewable fuels.

For the sake of all of us—and our children, grandchildren, and future generations--DEQ must adopt rules consistent with the CPP as approved by the Environmental Quality Commission. I urge you to make the rules as rigorous as possible to assure a reduction in carbon emissions.

Sincerely,

Becky Orf, Ashland Or 97520

Dear Climate DEQ,

I recently converted my home from all electric heating to a gas furnace. My electric bill was reduced by a third and my gas bill barely increased. It is not efficient to heat homes with electricity.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Monday, October 9, 2023 7:56:33 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Linda Stork

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Ronald Hylton

Dear DEQ,

Thanks for allowing me to comment on the climate action plan; this is a crucial subject for all of us and I hope to help get it right.

My comment is to include region wide renewable resources rather than more geographically limited areas in planning and calculating progress. In our Western region the power needs and power generation vary widely within timeframes, and power transfer and storage between areas is likely to be part of a less wasteful power plan.

Craig Zarling

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Abby Dalke

**Date:** Tuesday, October 10, 2023 9:31:50 AM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Michele Jenkins

You don't often get email from [lmbrightbill@gmail.com](mailto:lmbrightbill@gmail.com). [Learn why this is important](#)

Please tell the Governor to ignore the whining of Big Business and proceed in all haste with all initiatives to save our planet. The concerns about costs may be immediate, but they ignore the long term costs to humans, plants, animals, and insects that inhabit this planet.

If CEOs are so concerned about costs being passed on to consumers, tell them to turn over their obscene paychecks to defray some of those costs. They are enriching themselves while passing the all more permanent costs to life on Earth onto their consumers.

And that's not called capitalism. It's called selfish greed masquerading as concern for the consumer.

Dear Nicole Singh,

The state of Oregon government agencies should not be taking actions which will increase the cost of heating our homes, hot water, and cooking. Energy market costs to the consumer should not be manipulated by the state causing increases in the citizens energy costs. This is wrong, and I oppose these actions in all ways possible. Today the government is treating us like wealthy folks who can just handle never ending increases in the cost of living.

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

**Subject:** Keep Energy Costs Low  
**Date:** Tuesday, October 10, 2023 9:50:12 AM

---

Dear Climate DEQ,

Forcing someone who's on a fixed income to spend thousands of dollars to convert to electric and then pay higher energy cost is criminal, unwise and uncaring.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Walt Ryder  
5426 Summerlake St SE  
Salem , OR 97306

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Julie Yeager

Dear Nicole Singh,

I was an information officer for two large energy companies, oil and nuclear, for ten years. To have an industrial age, there is no escape from the utilization of fossil fuels. Prior to the industrial age, the carrying capacity of the earth was thought to be around one billion people. No matter what we do, great disruptions are coming as fossil fuels near exhaustion. There is no legislative or technical escape from what is coming. All the regulations you are contemplating are senseless and serve only to placate profoundly uninformed elites.

Sincerely,  
Eugene Brown

**Subject:** Keep Energy Costs Low  
**Date:** Tuesday, October 10, 2023 10:50:07 AM

---

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Richard Lathrop

**Date:** Tuesday, October 10, 2023 12:10:06 PM

---

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Terry Sladky

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Anthony Lash

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Nadene LeCheminant  
1665 Cottage St SE  
Salem, OR 97302

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Please stay strong in the face of industry push back to weaken the Climate Protection Plan.

I am concerned that of 14 members of the rule-making advisory committee, only two are public interest groups. How can such a heavy reliance on the regulated industries' input serve the public interest?

Also, I am concerned that the current proposed rule amendments will compromise the program's intended public health, economic, and employment goals, and hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities.

Northwest Natural Gas is already seeking to comply with the CPP by purchasing Renewable Thermal Certificates associated with RNG outside of Oregon. Please strengthen requirements by restricting bio-methane used for CPP compliance to that which would produce direct benefits to Oregonians by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon.

Also please strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program. As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. I live in Eugene, where J. H. Baxter company polluted neighboring residential lots, causing severe damage. I really appreciate the DEQ's part in getting this pollution stopped.

The Climate Protection Plan is a wonderful program. Your work to keep it strong is very important.

Thank you for working to retain a robust Climate Protection Plan, and your time to consider my comments.

Sincerely,

Nancy Ahnert

Eugene, Oregon resident

You don't often get email from [zwkeaton@gmail.com](mailto:zwkeaton@gmail.com). [Learn why this is important](#)

Chair George, Vice Chair Baraso, members of the Commission:

My name is Elizabeth Keaton and I am a volunteer with Families for Climate. I am a parent to two Oregonian children and I am writing this testimony because as they're parent my most fundamental responsibility is to protect them from harm, and irreversible climate change gravely threatens their future.

The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science. However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

1. **Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.
2. **Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rule making and please make Oregon be the voice of climate change our country needs!

Respectfully,

Elizabeth

I am an Oregonian who wants state action to address the climate crisis, and I oppose efforts to weaken the Best Available Emissions Reduction rules. I urge rules that put polluting industries on a downward trajectory of emissions;

The DEQ must adopt rules consistent with the CPP as approved by the Environmental Quality Commission.

Please make the rules as rigorous as possible to assure a reduction in carbon emissions.

Thank you,

Linda Frank, Bend Oregon

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Michael TerBush

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Bill Cassidy  
3312 NE Holman St  
Portland, OR 97211

Dear DEQ personnel,

I am writing to ask you to do all you can to ensure that Oregon moves forward on reducing the causes of climate-warming. Please do not allow fossil fuel industries to coerce you into allowing continued and new pollution.

**Please do not change anything that would undermine the CPP!** It is a program that is essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month engagement process.

I am concerned that DEQ's currently proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit increased climate pollution in Oregon and elsewhere.

I therefore strongly urge DEQ to amend the proposed rules by:

Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.

Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon.

I also strongly support maintaining protective restrictions on biomethane accounting, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.

Doing so will not only help ensure that Oregon reduces emissions risks, but will also maximize the associated job creation, cost saving, public health, and economic development benefits for Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments. Let's stay on track to achieve our climate goals. Thank you for your service. Let's make our children proud.

To whom it may concern,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ **not** to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because new opportunities for development across will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities. All this does it push business to areas with less stringent climate regulations, which in turn results in more emissions.

Please confirm that DEQ will **not** include geographic limits for decarbonized fuels like renewable natural gas and **will** allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule. While we welcome programs that benefit the environment, all this does is add financial stress to Oregonians without actually achieving any emission reductions.

**Please keep costs down and focus this program on quantifiable solutions to address climate change.**

Sincerely,

Payton Smith

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

This is in reference to the request for comments posted at <https://ormswd2.synergydcs.com/HPRMWebDrawer/Record/6391239/File/document>.

I have reviewed the material, and find the proposed rules to be fair and reasonable. The development of "chain of custody" for our energy sources, from initial production to final use, will help us better understand our markets and real-world infrastructure. Suppliers and distributors will likely complain of the increase in recordkeeping burdens, but I do not regard that as sufficient objection. Having accurate knowledge will be an indispensable support in our efforts to decarbonize.

I would encourage the EQC to adopt the proposed rules.

Department of Environmental Quality,

Thank you for letting me comment on DEQ's 2023 climate rulemaking. I have studied some atmospheric science and worked in an atmospheric science lab as staff so I am well aware of the critical importance of addressing climate change. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate, ecosystems globally and for communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking is extremely important for ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP— a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon. Biomethane like any methane is a very powerful greenhouse gas with a huge potential to contribute to climate change.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

## A Plea for Fair Consideration: **DEQ 2023 Proposed Rulemaking on Bio Methane, Lookback & Book and Claim.**

The State Oregon Department of Environmental Quality (DEQP is seeking feedback from the advisory committee and the public on these factors and the proposed changes to the reporting requirements:

Dear Department of Environmental Quality (DEQ) Team,

As a concerned business owner in the State of Oregon, I want to take a moment to express concerns and perspectives regarding proposed DEQ changes to Bio-Methane regulation, Book and Claim accounting, all types of commercial Hydrogen and the “Lookback” for Covered Entities as outlined in the 2023 Rulemaking process.

First and foremost, we wish to emphasize that petroleum-based energy, while often criticized, plays a crucial role in our state's economy and energy reliability. It provides not only energy but also economic development opportunities and contributes significantly to job creation within Oregon. It is essential that we view all energy choices in the portfolio holistically, considering both the benefits and potential costs, particularly in terms of economic impact and human flourishing.

During the discussions held by Zoom DEQ climate Rulemaking Public Hearing on September 18<sup>th</sup>, it was apparent that certain groups held reservations about allowing covered entities in Oregon to further utilize widely accepted book and claim accounting for Bio-Methane originating from other states. However, these groups seem to also support the utilization of electric vehicles manufactured elsewhere outside of the state, as well as the importation of electricity generated outside of Oregon without a direct economic benefit to our citizens. Consequently, the standards being proposed for Bio-Methane

appear to differ from those standards when applied to out-of-state electricity.

We urge DEQ to maintain the current regulations pertaining Bio-Methane without any further regulation changes. The book and claim accounting procedure has proven to be entirely suitable for the utilization of out-of-state Bio-Methane in Oregon's electricity generation sector. Historically, the covered entities within our state that generate electricity have dutifully complied with DEQ's established rules. Altering these rules would likely result in increased electricity costs, which would ultimately affect consumers, including those in environmental justice communities that DEQ advocates for. Therefore, to minimize costs for all Oregonians in order to achieve an equitable outcome for all, DEQ should refrain from altering these existing regulations. The reality is that forthcoming technological advancements hold the promise of reversing the upward trajectory of CO<sub>2</sub> levels when the need arises. However, what cannot be reversed is the profound economic distress inflicted upon climate justice communities if DEQ were to approve hastily and further eliminate CO<sub>2</sub> emissions by reshaping existing CHG program rules while giving undue credence to climate change advocacy groups. We ask that all opinions be considered and used as input in shaping future policy.

We strongly believe that Bio-Methane should not be subject to geographical constraints when it comes to book and claim reporting. DEQ should not require that Bio-Methane be injected into a natural gas pipeline within the State of Oregon. Furthermore, there should be no restrictions on the vintage use of Bio-Methane for greenhouse gas reporting, and no time constraints should be imposed. Bio-Methane should be allowed to be claimed and delivered to end-users within our state, even if it displaces natural gas used in a pipeline connected to Oregon. Renewable CNG is nothing short of a miraculous energy source that should not be disparaged. DEQ should encourage more Renewable CNG.

The book and claim regulations initially established by DEQ at the inception of the Greenhouse Gas Reporting program should remain unchanged. These regulations have served Oregon well, striking a balance between environmental concerns and the practical realistic needs of our state's energy infrastructure.

Hydrogen, being derived from Natural Gas via reforming, often referred to as “Gray Hydrogen”, boasts considerably lower emissions compared to conventional gasoline. Moreover, Blue Hydrogen, produced through the same Natural Gas feedstock with carbon capture, presents an even more environmentally friendly option. In our view, these alternatives merit a substantial role in the broader Hydrogen conversation. Additionally, the prospect of generating hydrogen from coal, known as brown hydrogen, adds further complexity to the discussion since the USA has an abundant 750-year supply of Coal.

In addition, we must recognize that while electric vehicles are promoted as a more environmentally friendly alternative, they are not entirely carbon neutral. The production of electric vehicles outside of the State of Oregon contribute to an overall EV carbon footprint and does not directly benefit our state's economy. It is essential to consider the entire lifecycle of these vehicles and make informed decisions that weigh their environmental impact against their economic implications compared to reliable, abundant fossil fuels.

We appreciate your time and consideration of these viewpoints. Our aim is to ensure a comprehensive evaluation of the proposed changes, keeping in mind the well-being of our state and its citizens. We trust that DEQ will make decisions that are fair, balanced, and in the best interests of Oregon.

Should DEQ proceed with altering book & claim, it risks triggering an energy crisis in Oregon, a crisis that may jeopardize the well-being of our citizens, leading to energy instability in the winters ahead. Responsibility for such a crisis would rest squarely on the shoulders of the anti-fossil-fuel movement in Oregon and DEQ directly.

In conclusion, we respectfully urge DEQ to consider amending regulations to incorporate a one-year lookback period. Such a revision would prove advantageous for all covered entities, including newcomers to the state’s petroleum market, and contribute to a more equitable and sustainable approach to our state's energy future.

Thank you for your commitment to responsible governance and environmental

stewardship.

Thank you,

Jason Cole

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Tuesday, October 10, 2023 3:55:32 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

I appreciate Oregon's efforts to address climate change and strongly support the intent of the proposed rules. I just ask that they be done with an eye to directly benefiting Oregonians as much as possible. And -- that the rules reflect that climate change has begun, is accelerating, and will profoundly impact Oregon. The better prepared we are, the less likely that these impacts will devastate communities. In the future's restrospectoscope, only the bolder actions will look commendable.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

**Subject:** Keep Energy Costs Low  
**Date:** Tuesday, October 10, 2023 4:30:06 PM

---

Dear Climate DEQ,

I have been without electricity in winter before. My natural gas fireplace was a lifesaver as temperatures fell. Also, we notice that natural gas as fuel is clean and affordable. Why would we not promote this abundant resource?

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Department of Environmental Quality:

My name is Ken Bonetti from North Bend. Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking as that will have far-reaching consequences for the climate and communities in Oregon.

Well-designed rules for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP) – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon. If such is allowed to happen, DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support after an extensive 18 month rulemaking and stakeholder engagement process.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I hope you will take these recommendations and make them part of the DEQ's rules and thereby protect Oregon residents and our climate from large new sources of climate pollution.

Sincerely,

Ken Bonetti

1997 Oak St.

North Bend, OR 97459

**We are Oregonians who strongly support state action to address the climate crisis.**

To this end, we ask that you :

- oppose efforts to weaken the Best Available Emissions Reduction rules and urge rules that put polluting industries on a downward trajectory of emissions,
- that you oppose allowing gas utilities to import unlimited Renewable Natural Gas from out of state to offset emissions,
- that you oppose allowing gas utilities to use hydrogen unless the hydrogen is produced with electricity generated by renewable fuels,
- that DEQ must adopt rules consistent with the CPP as approved by the Environmental Quality Commission.

Thank you for your consideration,

Dr. Steven and Jean Carlton

Bend, Oregon

Dear Nicole Singh,

As senior citizens who rely on renewable natural gas to heat our home, my husband and I are appalled by the state's and DEQ's heavy-handed approach to limiting our energy options in the Climate Protection Program. This move unreasonably threatens our energy availability and feasibility.

In addition, the DEQ exaggerates the role of renewable natural gas in climate change scenarios, especially in comparison the primary sources of carbon emissions.

The perspective of targeting users of natural gas is an inequitable, ineffective, and costly means of carbon reduction.

Dear Nicole Singh,

As an Oregonian, I'm quite concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because having more opportunities for development will increase supplies and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would have the same limiting impact as say excluding wind and solar resources from outside of Oregon, which would impact our ability to meet our clean electricity goals.

- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

- Arbitrary geographic boundaries simply don't improve our situation and will very likely increase costs for all Oregonians. I don't see that as the right path.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

**Date:** Tuesday, October 10, 2023 8:20:32 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

It is not the role of government to impose limits on any kind of energy.

Further, the "SCIENCE" behind climate change is corrupt and flawed.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Ryan Seigneur

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Tuesday, October 10, 2023 8:23:29 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

I urge the DEQ to return to the original Climate Protection Plan. Community Climate Investment must promote social justice. Large emitters must be accountable for the pollution they produce, there can be no expansion of existing pollution sources, and there can be no development of new sources. This is just common sense if we are serious about eliminating our dependence on fossil fuels. There is no time to waste.

Thank you for taking comments.

You don't often get email from bsuprena@gmail.com. [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Brice Suprenant

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

To: Department of Environmental Quality

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program

Dear Oregon Department of Environmental Quality - 2023 CCP,

Please take climate change seriously. So far, our government says it but doesn't ACT it. Stop "Pay to Pollute",

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Edwin Schmidtke

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Patty Herzog

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

You don't often get email from [bruce@brucefontaine.com](mailto:bruce@brucefontaine.com). [Learn why this is important](#)

“DEQ must ensure the Climate Protection Program stays on track to achieve its climate goals and deliver public health, economic, and job benefits for Oregon communities. Specifically, it is vital that DEQ strengthen its [current proposed rules](#) by:

1. Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
2. Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be *more* polluting than even natural gas.
3. Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.”

I will add that Oregon compliance standards cannot be undermined by corporate attempts to circumvent the intended benefits to the environment.

Bruce Fontaine

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

---

Dear Climate DEQ,

No matter what the income or status families have this will effect everyone rich and poor. Stop attacking the people of this state and country with baseless extremist taxes and money grabs!

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Dan Broome  
496 N 6th St

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

We need to be doing all we can to reduce emissions in this critical period. We should only be using green hydrogen, and not pollute communities.

Sincerely,  
Drew Simrin

Dear Climate DEQ,

Interestingly, I'm waiting in line at a DEQ Test Station as I compose this email, a long line with dozens of other cars with idle engines or constant restarts--all adding to the unhealthy gases! Furthermore, because of the high cost of this unnecessary test (I pass every time) and registration renewal, I am cutting into my food budget to pay for this. My guess is that no policy maker is in my position..

I KNOW that there are better ways to save our planet and people. Cheaper and more environmentally friendly energy resources exist. Solar and wind are not the way to go--for many reasons.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

With all the greenwashing (deceptive claims of climate action), compliance with any new rules must be independently verifiable. False claims must be punished with non-negotiable fines. Public reporting must be provided for accountability. No cozy agreements, no loopholes for lawyers to exploit, no conflict of interest with investigators or enforcers. No unfair competition for businesses that comply. No corporate capture (rules made by those subject to the rules.)

Dear Nicole Singh,

As an Oregonian, I'm very upset about the lies, deceptions and money grab of the Climate Protection Program. I demand DEQ not to further increase costs by imposing geographic limitations on renewable clean natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for low income and middle class Oregonians.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon due to political justification.

- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities. Natural gas is low carbon. Ever see soot on a gas exhaust vent, NO! BTW CO2 is NOT A Greenhouse Gas! (<http://www.co2science.org>)

Please confirm that DEQ will not include geographic limits for decarbonized fuels like clean renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Now go educate yourself about what is driving recent weather changes. Climate has changed since day 1 and will continue to change to the end of days. Thank God for that otherwise we would still be in a "Ice Age". Climate change has become a political farce for the left wing nut party. They use it to gain power by spreading fear. Please go to <http://icecap.us/> to get educated. Some scientists have found they can make more money lying than being factual. Many other places to get educated. DEQ is comprised of un-elected officials placing crushing economic disaster on those already facing hardship from poor economic policy. The rich don't care, it is inconsequential to them, the poor and middle class carry the full burden. STOP this insanity NOW!

Please keep costs down and focus this program on quantifiable solutions to address clean water and air from toxic chemicals and natural radon sources which is of much greater concern.

Department of Environmental Quality,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking. As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules.

- 1) Restrict biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.
- 3) Not use old AP-42 standards written by the oil industry with self-reporting based on the BAER survey. This methodology has been shown to vastly underestimate the amount of emissions by up to 59% and for the Climate Protection Plan to realistically address emission reductions is fully insufficient. Other states utilize the preferred new standards of EPA methods 204 and 325 to replace company guesstimates with actual air quality monitoring DATA, emissions inventories, and health assessments. Oregon DEQ should put an end to industry guesstimate self-reporting through an industry-stacked methodology.
- 4) The missing components to the carbon intensity (CI) value calculations, not being listed "Under OAR 340-215-0042 or 340-272-0455 under the documentation required sections, biofuels and other so-called renewable fuels, should not only report on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption.
- 5) Not remove the phrase "additional documentation must be made available for verification upon request"
- 6) Not exempt exporters and transporters of fuels should and should have to list the final destination of the fuels(340-215-0115).
- 7) While they may utilize devices to reduce emissions during pumping phases, the open venting to reduce sparking must also be taken under consideration as should potential leakage from during storage and transfers.
- 8) Any substantive change of use should require a new ACDP (Air Contaminant Discharge Permit) or Title V permitting instead of being allowed to operate under old permits.

Finally, It is very disappointing that the roster of people involved in the rule making is heavily stacked by industry.

Thank you

Mark Darlenzo  
Portland OR 97213

**Subject:** Keep Energy Costs Low  
**Date:** Wednesday, October 11, 2023 2:20:07 PM

---

Dear Climate DEQ,

Gas is a clean energy source both in extraction and use. It is also far more affordable than electric. In forcing these unsubstantiated "climate saving changes," legislators are placing an undue burden on middle and lower income individuals. Electricity has to come from somewhere. Where is legislation going to get it? Unreliable wind or solar? These have already been proven to be inadequate and expensive (look to California and Texas as proof). Lithium batteries which are strip mined, dangerous, and are environmental unsafe on disposal. Same goes for solar panels. How is this a better choice? Coal? Water? Nuclear? None of these answers will satisfy climate/environmental extremists. Do not cave to radical extremists. Look to actual facts, economics, and REAL science. Allow instead for industry to improve and create better systems. Rather than upending everything without a true scientific basis.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Christine M Harris

Dear Nicole Singh,

By scanning through the reams of rule-making documents, it becomes immediately obvious that DEQ is a bloated agency wasting millions of our taxpayer dollars. No wonder you try to tax us in every way possible. It is not about saving the planet, since you can't even make a dent in China's new coal plant capacity. It is about the pure greed of progressivism.

Stop attacking our energy choices.

Dear Climate DEQ,

Okay, I'm not against trying to clean up the environment. There are very few of the citizens of our state that are. But you have to use some common sense, which seems to be in very short supply nowadays. Stopping the production and use of natural gas would have a devastating impact on hundreds of thousands of residents in the Pacific Northwest and most certainly those on fixed incomes. Don't let those pushing bonehead extreme agendas limit and or eliminate an extremely needed and valuable resource.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Dear Nicole Singh,

I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs on Oregonians by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

More importantly, any DEQ/Oregon program designed to address climate change is doomed to fail as Oregon activities are not the source of changes in climate. The vast majority of changes in climate are naturally occurring. Requiring Oregon's citizens to pay extra fees, taxes, or artificially increased costs to address this issue just causes poverty that could have been avoided. Please keep costs down and delete this and other climate change programs.

**Date:** Wednesday, October 11, 2023 4:16:42 PM

---

You don't often get email from ehod1@yahoo.com. [Learn why this is important](#)

Hello,

I am writing in regard to the proposed rules for the Climate Protection Program. Please consider the following.

1. Polluting industries must be on a downward trajectory of emissions. Do not weaken the Best Available Emissions Reduction rules.
2. Do not allow gas utilities to import unlimited Renewable Natural Gas from out of state to offset emissions.
3. Only allow gas utilities to use hydrogen if the hydrogen is produced with electricity generated by renewable fuels.

DEQ must adopt rules consistent with the CPP as approved by the Environmental Quality Commission. DEQ must make the rules as rigorous as possible to assure a reduction in carbon emissions.

Thank you,

Eric Halperin

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 11, 2023 5:05:52 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Wayne Frey

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 11, 2023 5:16:34 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

**Subject:** Rulemaking Comment  
**Date:** Wednesday, October 11, 2023 5:19:41 PM

---

You don't often get email from [dolgonas@msn.com](mailto:dolgonas@msn.com). [Learn why this is important](#)

Greetings,

I want to submit my comments about the on the proposed [Climate 2023 Rulemaking](#), a joint rulemaking of DEQ's teams that implement the Greenhouse Gas Reporting Program (GHG RP), Third Party Verification (3PV) and Climate Protection Program (CPP).

I am concerned that the proposed rule is too reliant on offsets rather than strong actions that will truly reduce GHG emissions. We are fortunate to have strong, clear policies addressing the need to reduce GHG emissions, and I ask that the focus remain clearly on reductions rather allowing GHG emissions to continue to rise due to allowance of offsets.

Thank you.

Dick Dolgonas  
Roseburg, Oregon

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 11, 2023 5:21:22 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

I urge the DEQ to hold energy industries to Oregon industrial pollution limits; furthermore, it is no secret that "offset" is nothing more than a slick way for industries to poster than they are working to meet climate standards, but most often the industries put money toward biomethane and biomass, for example, rather than transition to clean energy. Help Oregon's CPP stay on tack to deliver the state's climate goals.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Ben Platt

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Oregon DEQ, please do every thing can to ensure Oregon has the best possible rules to regulate industry and reduce climate change.

Sincerely,  
Bessie Joyce

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Wednesday, October 11, 2023 5:49:47 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

**Subject:** Keep Energy Costs Low  
**Date:** Wednesday, October 11, 2023 6:10:06 PM

---

Dear Climate DEQ,

Natural gas is a clean fuel, much cleaner than coal, but still gives us the 24 hour energy that we need to run our businesses, factories, air conditioning, etc. also, cooking with natural gas is superior to electric. We need dependable, affordable fuel sources for our country to prosper. Families are suffering from high energy, food and housing prices. We will soon have no middle class left if we keep going in this direction. None of the climate alarmists even seem to know that CO2 comprises only .04% of our atmosphere. that is only.4/10,000 ths, which is not very much!

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Cindy Tobiska

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 11, 2023 6:20:05 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Dear Oregon Department of Environmental Quality - 2023 CCP,

Based on 30 years of work on climate change I've learned that offsets, while sounding good, are complete crap. If we're serious about transitioning to clean energy then we should help those industries that can switch to cleaner energy sources to do so. But fossil fuels need to be off the bargaining table over ate to be serious about meeting our climate protection goals.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Wednesday, October 11, 2023 7:38:45 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Christine Reed

**Subject:** Keep Energy Costs Low  
**Date:** Wednesday, October 11, 2023 8:50:11 PM

---

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Steph Spencer

Bend, OR 97703

**From:** [Civiclick](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Rulemaking Comment: Please Keep Costs Down  
**Date:** Wednesday, October 11, 2023 9:26:42 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
patrick vanderhout

Dear Climate DEQ,

My wife and I prepared for retirement by investing in a residential solar electric system and a gas powered furnace. We hope to live out our days enjoying the benefits of these efficient, cost-saving energy sources. We hope we will not have to depend on heating our home with our wood stove because activists have lobbied to restrict natural gas production and a resulting higher cost.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

James Boeckl  
1287 Orchid St

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
John Quilter

**Date:** Wednesday, October 11, 2023 10:08:38 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

Offsets are off the table as a climate solution! Offsets are a game with no real winners .

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Joan Spiering

**Date:** Wednesday, October 11, 2023 10:10:10 PM

---

You don't often get email from [stevedeeroyal@gmail.com](mailto:stevedeeroyal@gmail.com). [Learn why this is important](#)

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Steve Royal

Dear Oregon Department of Environmental Quality - 2023 CCP,

We can't buy our way out of the climate crisis. Industries and businesses must stop polluting, period. It makes no sense for them to buy credit for reduction in pollution that is not their own.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Diane George

Dear Oregon Department of Environmental Quality - 2023 CCP,

Stop allowing the oil and gas industry to destroy our future, make our populations sick, and contribute to species collapse, catastrophic storms, and toxic air. We need a new energy future NOW. I reject the industry's effort to avoid regulation. DEQ needs to hold polluters accountable.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. **Subject:** Rulemaking Comment: Please Keep Costs Down  
**Date:** Thursday, October 12, 2023 5:18:55 AM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Amanda Jarvis

**Subject:** Keep Energy Costs Low  
**Date:** Thursday, October 12, 2023 5:50:12 AM

---

Dear Climate DEQ,

Energy isn't a one size fits all. Before moving here I converted my prior home from oil heat to NG making it more efficient and cleaner. NG is already more efficient than other forms of energy. Keep choice and costs low.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Department of Environmental Quality,

It is very important to me to be submitting my comment on DEQ's 2023 climate rulemaking. The Climate Protection Program (CCP) is Oregon's best chance to reach its climate goals, which it must do - **bottomline**. It:

- Requires oil companies and gas utilities\* to cut emissions 50% by 2035 & 90% by 2050;
- Regulates major industrial facilities (BAER)
- Invests in environmental justice communities (CCI program)

As the only existing state regulation on major industrial emitters, it is vital that the CPP remains a very effective regulation, and that it works to ensure science-based emissions reductions from existing stationary sources of greenhouse gas emissions and deter development of new stationary sources in Oregon.

This rulemaking – if done well – could help to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, the proposed rule changes / amendments amount to the creation of loopholes, and therefore the power and integrity of the program would be greatly diminished and undermined, and they would render the program to be not much more than green washing tactics. Not only would these changes weaken Oregon's ability to reach its aggressive climate goals, they would also decrease the intended economic benefits for Oregon that would derive from the Community Climate Investment (CCI) program. These vital

benefits are necessary to help Oregon make the difficult transition away from dependence on sources of greenhouse gas emissions. We do not have another decade to waste on green washing tactics. The program was adopted with overwhelming public support following an extensive 18 month rulemaking and stakeholder engagement process.

Specifically, I am concerned that DEQ's current proposed rule changes would allow regulated gas utilities to rely on out-of-state biomethane investments, and they would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane or hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon;

**Please improve compliance requirements to disallow using book and claim accounting for hydrogen applications and keep investments in state. And please maintain strong reporting requirements - including lifecycle emissions - for all hydrogen production.**

and

- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

**We cannot continue to enable the development of new sources of GHG emissions or expansion of existing sources.**

**That would fly in the face of the CPP's stated equity and climate goals. Any new stationary source or any**

**proposed modification that has the potential to emit more greenhouse gases in any quantity should complete a BAER assessment prior to construction.**

Thank You.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Derek Gendvil  
9030 W Sahara Ave PMB 360  
Las Vegas, NV 89117

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Thursday, October 12, 2023 7:58:45 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

**Subject:** Rulemaking Comment: Please Keep Costs Down  
**Date:** Thursday, October 12, 2023 8:29:06 AM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Sandra Hamilton  
13235 SW 31st Street  
Beaverton, OR 97008

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Thursday, October 12, 2023 8:45:08 AM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Laura Merrill  
2420 SW 76th Avenue

Merril.Laura@gmail.com

**From:** [Craig Fleishman](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Keep Energy Costs Low  
**Date:** Thursday, October 12, 2023 9:10:07 AM

---

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Craig Fleishman

**Date:** Thursday, October 12, 2023 9:35:38 AM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Penney Reed

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

TX

Sincerely,

Hello,

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health

assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

**Subject:** Keep Energy Costs Low  
**Date:** Thursday, October 12, 2023 10:20:26 AM

---

Dear Climate DEQ,

Please keep the decarbonization options and keep the utility bills as low as possible.

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Cathy Steere

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Tara Kreft

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,

Hello Oregon DEQ,

In all respect, I too often find that the DEQ accommodates industry over the environment and people. I wish as strongly as I can that you take courageous action now. I live in St. John's right across the river from the CEI Hub and near other industry. Our community is not protected from air pollution by the DEQ. We know that. It needs to change.

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for

hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Laurie King  
8716 N. Edison St. Portland 97203

On Thu, Oct 12, 2023 at 11:18 AM Laurie King <[laurie70.king@gmail.com](mailto:laurie70.king@gmail.com)> wrote:

Hello Oregon DEQ,

In all respect, I too often find that the DEQ accomodates industry over the environment and people. I wish as strongly as I can that you take courageous action now. I live in St. John's right across the river from the CEI Hub and near other industry. Our community is not proteced from air pollution by the DEQ. We know that. It needs to change.

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic

methane derived from anthropogenic carbon sources does not comply with the CPP.

4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately assess the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Barbara Ford

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
George Autry

**Subject:** Rulemaking Comment: Please Keep Costs Down  
**Date:** Thursday, October 12, 2023 11:40:52 AM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
George Larson

**Subject:** Keep Energy Costs Low  
**Date:** Thursday, October 12, 2023 11:50:09 AM

---

Dear Climate DEQ,

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

To Whom it May Concern

As a citizen who breathes the air, drinks the water, and hopes that our state will thrive in a healthy environment I am deeply concerned that DEQ must protect these vital resources. We all know that certain business practices produce toxic substances. It is in all of our best interests to deal with these in a way that does not harm our health. Whatever the process, the result must provide us with that healthy environment.

As you know, more and more Oregon residents are concerned enough to fight for a clean environment. We will stand up and denounce anyone who stands in the way. I ask you please find the will and the way to be an asset, not a liability.

Thanks,

John Paisley,

**Subject:** Make this 2023 Climate Rulemaking Count!  
**Date:** Thursday, October 12, 2023 12:38:12 PM

---

Dear Oregon Department of Environmental Quality - 2023 CCP,

We are very, very quickly running out of time to keep our climate survivable. There is no business to be done on a dead planet.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Rebecca Hollenbeck

Greetings,

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it!

I appreciate your service,

**Paula Dougherty**

Chair George, Vice Chair Baraso, members of the Commission:

My name is Darcy, and I am writing this testimony because as a community member, and aunt, my most fundamental responsibility is to protect current and future generations from harm, and irreversible climate change gravely threatens their future.

The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science. However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

**Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.

**Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Respectfully,

Darcy

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Thursday, October 12, 2023 1:24:35 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Gary Walker

All CPP implementation should focus on reducing costs, supporting RNG, and supporting hydrogen blending with natural gas. Any attempt to reduce natural gas connections should be shunned. During an ice storm 2 winters ago, I was without power for several days. Because I have natural gas I had hot water, I could heat with my gas fire place, and I could cook with the stove and natural gas BBQ.

Dear Oregon Department of Environmental Quality - 2023 CCP,

Renewable Offsets are unacceptable in Oregon in the fight against climate change

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking ? if done well ? will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits? ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Greetings,

The Climate 2023 Rulemaking should move vigorously to take the strongest possible action to reduce emissions and protect our climate. We are facing an emergency and need to address it as such.

For instance, I commend the addition of 340-215-0130 to OAR Chapter 340, Division 215 to specify separate violations.

I also offer the following additional requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon’s industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous

ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Sincerely,

Frann Michel, Ph.D.

Hello, I live near the blue Liquid Natural Gas (methane) storage tank near the St John's Bridge. I imagine what will happen when the big earthquake comes nearly every night. Doesn't promote sweet dreams.

Thank you, Dave King

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and

fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Kate Miller

Dear DEQ Team,

I want to share my concerns and thoughts about the proposed changes to the Climate 2023 Rulemaking by DEQ. These changes involve Bio-Methane regulation, Book and Claim accounting, commercial Hydrogen, and the "Lookback" for Covered Entities.

First, it's essential to understand that petroleum-based energy, despite criticism, plays a vital role in Oregon's economy. It not only provides energy but also contributes to economic development and job creation. We should consider the benefits and potential costs of all energy choices, especially in terms of economic impact and human well-being.

During a recent DEQ climate Rulemaking Public Hearing on September 18th, it became clear that some groups have reservations about allowing covered entities in Oregon to use book and claim accounting for Bio-Methane from other states. However, these groups seem to support the use of electric vehicles made outside Oregon and the importation of out-of-state electricity, even without direct economic benefits to our citizens. This creates a difference in standards between Bio-Methane and out-of-state electricity.

We urge DEQ to maintain the current regulations for Bio-Methane without further changes. Book and claim accounting has worked well for using out-of-state Bio-Methane in Oregon's electricity generation. Changing these rules could lead to higher electricity costs, impacting consumers, including those in environmental justice communities. To minimize costs and achieve equity, DEQ should refrain from altering existing regulations. Technological advancements can help with CO2 levels, but economic distress from hasty rule changes cannot be easily reversed.

We believe Bio-Methane should not be subject to geographical constraints for book and claim reporting. There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas Reporting program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering. Electric vehicles, while promoted as environmentally friendly, are not entirely carbon neutral, and their production outside Oregon doesn't benefit our state's economy. We must

consider the entire lifecycle and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy stability. We believe a one-year lookback period should be incorporated into the regulations to benefit all covered entities.

Thank you for your commitment to responsible governance and reliable energy stewardship.

Sincerely,

Dear Oregon Department of Environmental Quality - 2023 CCP,

As an Oregonian I am extremely concerned about our State's ability to reach our climate goals. To fail to do so is to fail the next generation. There are currently too many loopholes to properly hold industry to the standards necessary to make change.

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking if done well will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,

Maren Salomon

We believe Bio-Methane should not be subject to geographical constraints for book and claim reporting. There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas Reporting program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering. Electric vehicles, while promoted as environmentally friendly, are not entirely carbon neutral, and their production outside Oregon doesn't benefit our state's economy. We must consider the entire lifecycle and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy stability. We believe a one-year lookback period should be incorporated into the regulations to benefit all covered entities.

Thank you for your commitment to responsible governance and reliable energy stewardship.

Sincerely,  
Kate

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Thursday, October 12, 2023 4:20:36 PM

---

Dear Nicole Singh,

I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) and renewable propane because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG and renewable propane would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.

- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and renewable propane and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and renewable propane and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,

**From:** [Lauren Lamb](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Climate 2023 Rulemaking: Appendix of Proposed Rules  
**Date:** Thursday, October 12, 2023 4:36:30 PM

---

You don't often get email from laurenl@berqrng.com. [Learn why this is important](#)

Dear Nicole and Elizabeth,

Our core business at BerQ RNG is developing and operating projects that turn biogas into RNG, creating healthy returns for our investors and project partners. We focus on developing small to medium-sized projects in Ontario, Quebec, and the Mid-Western to the North-Eastern United States. Our team brings their 95+ years of combined industry experience to each project, is technology agnostic, and chooses the best in class technology for each specific development.

We are a lean RNG developer with several projects in execution, helping dairy farms, municipalities, and Fortune 500 companies to reduce their environmental impact and create economic value.

BerQ RNG offers the following comments regarding the Oregon Department of Environmental Quality's (DEQ) final draft Appendix of Proposed Rules. Specifically, we would like to express our support for, and urge DEQ to finalize its current definition for "Book and Claim" within the Greenhouse Gas Reporting Program (GGRP) portion of the regulations, as follows:

*"Book and Claim" refers to the accounting methodology where the environmental attributes of an energy source are detached from the physical molecules when they are commingled into a common transportation and distribution system for that form of energy. The detached attributes are then assigned by the owner to the same form and amount of energy when it is used. For the purposes of this division, the common transportation and distribution system must be connected to Oregon.*

### **Maintaining Alignment with Existing Programs in Oregon and Worldwide**

This framework remains in line with existing policies in Oregon which are designed to incent the development and use of renewable gas, an array of state- and federal-level programs, and international standards that govern greenhouse gas (GHG) accounting:

Oregon's renewable gas procurement targets established by SB 98<sup>[1]</sup> and the Clean Fuels Program<sup>[2]</sup> are two key programs which are designed to incent the use of renewable natural gas (RNG) in Oregon's residential & commercial thermal and transportation sectors. These sectors comprised around 69% of the state's GHG emissions in 2021,<sup>[3]</sup> requiring expedient deployment of clean fuels and electricity to decarbonize. **DEQ's current draft Book and Claim definition fits with these programs, which allow for the procurement of renewable gas via existing energy transportation and distribution infrastructure.**

The use of market-based instruments within a system that utilizes book-and-claim accounting can be seen in Renewable Gas Standard and Clean Heat Standard policies in California, Colorado,

Minnesota, New Hampshire, British Columbia, and Quebec. The same system is employed under Low-Carbon Fuel Standard programs in California, Washington, British Columbia, and Canada on the federal level, as well as EPA's Renewable Fuel Standard. Furthermore, other voluntary renewable energy procurement frameworks from World Resources Institute, Climate Disclosure Project, The Climate Registry, RE100, and Airport Carbon Accreditation allow for the purchase of RNG certificates to qualify in this manner.

Importantly, GHG accounting leader World Resources Institute (WRI) is currently updating its standards surrounding market-based procurement. Their recently published guidance explicitly allows companies reporting under the Greenhouse Gas Protocol to use market-based instruments for renewable gas purchases, stating that "companies purchasing certificates may wish to consult with their auditors and consider rules provided by relevant target-setting programs or applicable regulatory schemes in their jurisdiction(s) on how to report these purchases in their reports."<sup>[4]</sup> In other words, these existing Book and Claim practices are deemed acceptable by WRI.

### **Avoid Limitations Which Would Hurt Renewable Energy Growth**

In finalizing its Book and Claim definition, DEQ must consider not only the objective of maintaining alignment with existing programs, but also the effects of potential limitations on market-based instruments. Specifically, we urge DEQ not to place artificial geographic limitations on renewable energy supply that are not also placed on the use of conventional energy supply. For example, in the case of imported renewable gas, such limitations would stifle industry growth in a time where it remains crucial to replace imported fossil gas and reduce methane emissions in the organic waste sector.

Injection into a common pipeline system is the lowest-GHG way of transporting renewable gases, book-and-claim layers well on top of the way conventional gas is traded and incentivizes the buildout of RNG resources in a rational way beginning with the most cost-effective projects. Renewable gas producers cannot change physical flow of the gas system significantly until volumes reach scale and displace a significant share of fossil gas. The supply of conventional gas which currently serves Oregon primarily originates out of state; the existing market for physical gas delivery optimizes moving gas from supply to demand in a least cost and generally lowest GHG manner.

Maintaining consistency and fungibility between all North American RNG markets through the aligned use of book-and-claim will increase competitiveness, improve investment certainty, and lead to the sustainable growth of the renewable gaseous fuel industry. The use of full book-and-claim accounting for the vast majority of North American RNG has already resulted in overwhelmingly positive greenhouse gas emission reductions.

### **Conclusion**

BerQ RNG appreciates the opportunity to provide feedback in support of DEQ's current draft regulations regarding renewable gas procurement under the GGRP. We urge DEQ to uphold this framework to incent (1) recycling of organic waste into renewable fuels and platform molecules which can (2) replace fossil-derived fuels and feedstocks in various sectors of the economy while (3)

reducing methane emissions and improving other air and water quality impacts associated with waste management in Oregon and beyond.

Sincerely,  
Lauren Lamb

You don't often get email from mdrembold@comcast.net. [Learn why this is important](#)

Dear Person:

I don't want any renewable path as it certainly becomes a muddled up mess. I am also tired of all the tricks encouraging people like me to sign up to a letter someone else wrote up. Any use of electricity in place of what we currently use is a huge mistake since electric power has been a concern for over 50 years (shortage) and the reason all household appliances wear an energy savings label worthy of tax rebates and such. Plus when you add that 70 percent of electricity is provided by fossil fuel -- it all actually becomes a joke. Create electric power with renewable energy?

Renewable energy is energy that is produced from natural processes and continuously replenished. A few examples of renewable energy are sunlight, water, wind, tides, geothermal heat, and biomass. If this is what is being proposed . . . . . lots of luck with that as it will be an order of magnitude more difficult, complicated, expensive, not able to support current requirements. And you certainly can't expect vehicles to run on that. Try selling the idea of nuclear energy and see how far you get with that.

-Dale Rembold-

Hello,

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. DEQ is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Sincerely,

Anne Bryant

Comments on **DEQ** Climate 2023 Rulemaking

subject:

Hello,

Given the short timeframe global scientists say we have to reduce emissions in half by 2025, it is imperative for all of our health and safety, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the **DEQ** is following a safe "status quo" path, rather than seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have

produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. [DEQ](#) is in a position of great power, and great responsibility-- please seize it! I appreciate your service.

Sincerely,  
Kathleen Boylan

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Re: Climate Protection Program received in testimony, submitted October 12, 2023  
From: Dale Fink

During the September 14, 2023 public hearing on Climate 2023 Realigning I made and public testimony. I said that at the EQC meeting in Newport September 14, 2023, Climate Action suggested that people watch DEQ's website to learn about the Best Available Emission Reduction (BAER) program. I did I noted that there are 14 facilities listed in here over 20,000 annual tons of CO<sub>2</sub> emissions. During my public testimony I said that fact has applied to DEQ to increase their Carbonless gas emissions from 97,000 tons per year which calculates to 1.5 tons per minute to 1,698,000 tons per year which calculates to 7 tons per minute. That would make West the largest greenhouse gas emitter in Oregon.

In 2012, three natural-gas-fired electricity producing plants greenhouse gas emissions range from 88,000 to 1,133 tons per year. Before it closed operating, the coal-fired Beattyville plant could emit 2,310,000 tons per year.

Of the 14 facilities subject to the Best Available Emission Reduction, only Amman's PEX. That Center has been called a PEX CO<sub>2</sub> emissions are about 97,000 tons per year. Note again that need is progressing in that Percentage of Significant Determination Application to DEQ to be allowed to emit 1,698,000 tons per year.

I said I read the Public comment received about Amman's Data Center, May 2023.

1. Oregon Legislatures
2. Climate Solutions
3. Green Energy Institute and Northwest Environmental Defense Center, a member of the 14-person Climate 2023 Realigning advisory Committee.

I said please act on the recommendations, and that 14 people serve on the Climate Realigning committee, and that only two people represent climate environmental organizations, the rest represent industry organizations, three environmental organizations are Climate Solutions, and Green Energy Institute. At the public hearing, a representative of one of those organizations provided detailed comment that encourage you to seriously consider, and please consider their written comments from the Oregon Legislative delegation, which includes input from Senators Jeff Merkley and Ron Wyden.

I also said that during Richard Whisman's leadership of the Department of Environmental Quality, he disbanded the DEQ Blue Ribbon Water Advisory Committee and the DEQ Air Toxic Advisory Committee because, from my point of view, any person who attended those meetings, was never trained with industry lobbyists. These committees were established with experts in Toxic Enforcement, epidemiology, EPA experience of present, etc. In other words, people who are not biased toward industry profits.

I said that I noted that the Climate Realigning Advisory Committee members were not a ratio of 12 to 2 in comparison, and that I was glad that Climate Solutions Green Energy, and other people join our climate testimony, even though that person had some input during the Climate Realigning Advisory Committee meetings.

To represent my public testimony after reading a error in the Oregonian by the reporter Gwika Womacka titled 'Climate-Change regulation challenged in court', in which it says with 'Students at Logan marched out of school March 2023 to protest NW Natural's effort to stop local identification efforts.' NW Natural and two other utilities, an industry group and a dozen other local trade organizations are now challenging the state's separate emissions reduction Climate Protection Program in court.

I encourage you use the best litigation attorneys at the Department of Justice who represents the DEQ and the Environmental Quality Commission to sue all the industry attorneys on this case.

See attachment titled 'Climate change regulation challenged in court by Gwika Womacka The Oregonian Oct. 1, 2023.docx'

Respectfully submitted,

**Date:** Thursday, October 12, 2023 7:34:14 PM

---

Dear Nicole Singh,

As an Earthling and Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. DEQ should not place geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Different parts of our country have unique environmental advantages and have something to offer this global problem. Carbon dioxide does not stop at the state border; nor should our solutions.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Tom Chau

**From:** [Lilly Hankins](#)  
**To:** [2023 Climate \\* DEQ](#)  
**Subject:** 2023 Climate Rulemaking  
**Date:** Thursday, October 12, 2023 8:49:48 PM

---

You don't often get email from [lilly.hankins@gmail.com](mailto:lilly.hankins@gmail.com). [Learn why this is important](#)

Dear Chair George, Vice Chair Baraso, and members of the Commission:

My name is Lilly Hankins and I am a volunteer with Families for Climate. I'm mother to a 7-year old daughter, and I'm writing this testimony because my primary job as her mom is to protect her from harm. Irreversible climate change gravely threatens her future and her chances of having a long and healthy life.

I'm grateful that Oregon has the Climate Protection Program; it is critical for Oregon to reduce our emissions as quickly as science says we need to. But I am concerned that DEQ's current proposed rules would undermine the effectiveness of the CPP and put the emissions reductions we desperately need out of our reach. Specifically, I'm concerned that the current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will slow the transition to non-emitting alternatives and will not deliver direct benefits to Oregonians. I am also concerned that the rules will allow new industrial emitters to produce unrestricted climate pollution in our state.

I'm asking DEQ to please, on behalf of our children, implement this program as strongly as it is intended. Please make the following changes to the rulemaking:

- Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians. The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.
- Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program. As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Respectfully,

Lilly Hankins  
Portland, OR

You don't often get email from [cabeckstany@gmail.com](mailto:cabeckstany@gmail.com). [Learn why this is important](#)

Your mission statement says it all, you are supposed to be "[maintaining and enhancing the quality of Oregon's air, land and water](#)" How do you do that if you write rules that give industry all the power? In case you haven't notice, we are in a worsening climate crisis and we got here BECAUSE of the free hand we have given industry. Please do the work you are supposed to do, the work that Oregonians want: protect our air and water and uphold the Climate Protection Plan.

Thus, I ask that you amend the proposed rules in the following ways:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you.

**From:** Laurie Dougherty <campaigns@good.do>  
**Sent:** Friday, October 13, 2023 5:46 AM  
**To:** 2023 Climate \* DEQ  
**Subject:** Strengthen the proposed 2023 climate rules

Department of Environmental Quality staff,

Thank you for the opportunity to provide comment on DEQ's 2023 climate rulemaking.

I have followed the development of Oregon's Climate Protection Program (CPP) since its beginning. The CPP must live up to its name as a program to protect the climate. This rulemaking will have far-reaching consequences for the climate and communities in Oregon.

By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon. However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts on communities and the climate are not sufficiently considered.

I am concerned that DEQ's current proposed rules would effectively undermine the CPP– a program that is absolutely essential to achieving our state's climate pollution reduction goals, and which was adopted with overwhelming public support following an extensive 18-month rulemaking and stakeholder engagement process. Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state. I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon; and
- 2) Disallowing hydrogen to count for CPP compliance unless DEQ ensures it is green electrolytic hydrogen, since other hydrogen sources and types are far more polluting and carry a host of risks for our energy system; and
- 3) Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction program.

Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Yours sincerely,  
Laurie Dougherty

Good afternoon DEQ Team,

Our goal is to give comments about how important fossil fuels are for the state of Oregon and emphasize to them that until there is a viable replacement, we can't afford to continue outlawing fossil fuels. We are already promoting "greener" energies such as biodiesel and renewable diesel only to be told by the climate activists that even those energies are not "green" enough.

Please see the attached letter.

Dear DEQ Team

Please read the attached letter about climate change and the proposed rule changes.

There is no way this country can function without the use of petroleum-based energy. I challenge anyone to look around, in your house, outside of your house and anywhere really, and find anything that is not tied to petroleum-based energy in one way or another.

Dear DEQ Team,

I want to share my concerns and thoughts about the proposed changes to the Climate 2023 Rulemaking

by DEQ. These changes involve Bio-Methane regulation, Book and Claim accounting, commercial

Hydrogen, and the "Lookback" for Covered Entities.

First, it's essential to understand that petroleum-based energy, despite criticism, plays a vital role in

Oregon's economy. It not only provides energy, but also contributes to economic development and job

creation. We should consider the benefits and potential costs of all energy choices, especially in terms of

economic impact and human well-being.

During a recent DEQ climate Rulemaking Public Hearing on September 18th, it became clear that some

groups have reservations about allowing covered entities in Oregon to use book and claim accounting

for Bio-Methane from other states. However, these groups seem to support the use of electric vehicles

made outside Oregon and the importation of out-of-state electricity, even without direct economic

benefits to our citizens. This creates a difference in standards between Bio-Methane and out-of-state

electricity.

We urge DEQ to maintain the current regulations for Bio-Methane without further changes.

Book and

claim accounting has worked well for using out-of-state Bio-Methane in Oregon's electricity generation.

Changing these rules could lead to higher electricity costs, impacting consumers, including those in

environmental justice communities. To minimize costs and achieve equity, DEQ should refrain from

altering existing regulations. Technological advancements can help with CO2 levels, but economic

distress from hasty rule changes cannot be easily reversed.

We believe Bio-Methane should not be subject to geographical constraints for book and claim reporting.

There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no

restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should

be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a

connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas Reporting program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering.

Electric vehicles, while promoted as environmentally friendly, are not entirely carbon neutral, and their production outside Oregon doesn't benefit our state's economy. We must consider the entire lifecycle and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy stability. We believe a one-year lookback period should be incorporated into the regulations to benefit all covered entities.

Thank you for your commitment to responsible governance and reliable energy stewardship.

Sincerely,

**Christa Nelson**

Chair George, Vice Chair Baraso, and Members of the Environmental Quality Commission,

Thank you for the opportunity to submit comments on DEQ's proposed rules for the Climate Protection Program (CPP), a program critical to Oregon's climate goals. My name is Dr. Ann Turner. I am a member of Oregon Physicians for Social Responsibility's Healthy Climate Action Team, 350PDX's Fossil Fuel Resistance Team, and the St. Andrew Catholic Church Ecojustice Team. I retired from a career in community health as a physician and as medical director at Virginia Garcia Memorial Health Center. I worked with some of the most vulnerable in our community—low income, minority, non-English speaking adults and families, including migrant and seasonal farmworkers, populations most likely to suffer from the devastating impacts of climate warming. The importance of climate justice cannot be overstated.

The Climate Protection Program is broadly supported by Oregonians and is critical to Oregon's meeting its climate goals. Its effectiveness relies on DEQ's rules administering the program. As a physician worried about the health of our communities, I am deeply concerned about DEQ's newly proposed rules about biomethane and about emissions from the expansion of large industrial sites. The Climate Protection Program is designed to reduce greenhouse gas emissions and air pollutants but DEQ's proposed rules may actually increase emissions.

With regard to biomethane, allowing gas utilities to use out-of-state biomethane investments, does nothing to benefit Oregonians. DEQ must require that both biomethane and hydrogen be generated and used in Oregon to be used for CPP compliance.

I also urge DEQ to strengthen its emissions reduction requirements for new or expanded large stationary sources in Oregon. It is disturbing that DEQ is still utilizing old AP-42 standards written by the oil industry with self-reporting based on the BAER survey. This methodology has been shown to vastly underestimate emissions by up to 59% and for the Climate Protection Plan to realistically address emission reductions is fully insufficient. Other states utilize the preferred new standards of EPA methods 204 and 325 to replace company guestimates with actual air quality monitoring DATA, emissions inventories, and health assessments. Oregon DEQ should put an end to industry guestimate self-reporting through an industry-stacked methodology.

The reality is that since the final CPP rules were adopted in 2021, emissions have increased not decreased from our industrial sector. As an example, if Amazon's permits are approved for expanding their operations in Eastern Oregon, powered by gas, their data centers will result in huge increases in pollutants, including greenhouse gas emissions, in vulnerable communities. In addition, the 2023 legislature adopted "Oregon CHIPS Act" that will increase the number of large manufacturing plants and, inevitably, GHG emissions. I strongly urge DEQ to strengthen its rules for large industrial facilities.

Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon Intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is complex which is why actual monitoring data and health assessments are preferable.

The climate clock is running out. DEQ has the authority and the moral responsibility to act to protect the health and safety of Oregonians **now** and must not be swayed by industry's demands for rules that increase their profits while destroying our health. Thank you for

considering my comments.

Ann Turner, MD

Dear Oregon Department of Environmental Quality,

Dear Oregon Department of Environmental Quality,

I was thrilled when, in Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, provide direct economic and environmental benefits to communities on the frontlines of climate change and environmental injustices, and more. As an Oregonian who strongly believes in my state taking meaningful, bold steps to mitigate the effects of climate change and provide direct support to frontline communities, I see the CPP as laying out a critically important path, especially since the CPP originally integrated strong community input.

However, I was disappointed to hear that the recent rule-making table did not include community input, and also that the results lacked in meeting the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians, and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for consumers in environmental justice and other communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis, rather than paying for cheap offsets in other places.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels such as "renewable natural gas" (which is still composed mainly of methane, a greenhouse gas 86 times more potent than carbon dioxide), or hydrogen that is produced in ways that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Thank you for considering these comments and recommendations.

Sincerely,  
Derek Gendvil

Hello you talk about replacing fossil fuels or doing away with them here's the problem you have no back up solutions solutions that you present us with don't work you're making environmentally friendly fuel that doesn't work at all the other deal is with heating oil do you want this on your conscience people freezing to death because they don't have no heat yeah maybe 2030 maybe 40 maybe 50 years you might be fossil fuel free but I doubt it because you're always going to need some kind of fossil fuel trying to save the environment which is not really working yeah the other countries that are producing emissions we're tied into these other countries we all know that we need rules and regulations but when you take it to the extreme that's where I draw the line the stuff you're putting on us is nonsense the electrical get grids are going to be forced with brown out black out and everything else we have no infrastructure in place to build nuclear plants to produce clean energy and by forcing the petroleum business out of business revenue that will be lost will be devastating where does the nonsense end and reality begin thank you for your time and have a nice day--

**To:** [2023 Climate \\* DEQ](#)  
**Subject:** Keep Energy Costs Low  
**Date:** Friday, October 13, 2023 9:10:06 AM

---

Dear Climate DEQ,

Let's not be stupid about this

As an Oregonian, I'm concerned about bearing the costs of the Climate Protection Program. I am concerned that some extremists are trying to take away my energy choice.

With historically high inflation and low-income communities usually suffering the brunt of high utility bills, I urge you to continue to keep our energy costs low. Please do not place geographic limitation on renewables such as renewable natural gas because more opportunities for developing RNG will increase supply and drive costs down for everyone.

Arbitrary geographic boundaries for RNG would be the same as excluding wind and solar resources from outside of Oregon.

Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.

Arbitrary in-state boundaries don't make any sense and will harm Oregonians at the pump and in their household.

Please confirm that DEQ will remove the geographic limitation on RNG and preserve all decarbonization options to keep costs down.

Thank you for your consideration,

Sincerely,

Farrell Fox

Dear DEQ Team,

I want to share my concerns and thoughts about the proposed changes to the Climate 2023 Rulemaking

by DEQ. These changes involve Bio-Methane regulation, Book and Claim accounting, commercial

Hydrogen, and the "Lookback" for Covered Entities.

First, it's essential to understand that petroleum-based energy, despite criticism, plays a vital role in Oregon's economy.

It not only provides energy but also contributes to economic development and job creation. We should consider the benefits and potential costs of all energy choices, especially in terms of

economic impact and human well-being.

During a recent DEQ climate Rulemaking Public Hearing on September 18th, it became clear that some

groups have reservations about allowing covered entities in Oregon to use book and claim accounting

for Bio-Methane from other states. However, these groups seem to support the use of electric vehicles

made outside Oregon and the importation of out-of-state electricity, even without direct economic

benefits to our citizens. This creates a difference in standards between Bio-Methane and out-of-state

electricity.

We urge DEQ to maintain the current regulations for Bio-Methane without further changes.

Book and

claim accounting has worked well for using out-of-state Bio-Methane in Oregon's electricity generation.

Changing these rules could lead to higher electricity costs, impacting consumers, including those in

environmental justice communities. To minimize costs and achieve equity, DEQ should refrain from

altering existing regulations. Technological advancements can help with CO2 levels, but economic

distress from hasty rule changes cannot be easily reversed.

We believe Bio-Methane should not be subject to geographical constraints for book and claim reporting.

There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no

restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should

be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a

connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas

## Reporting

program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering.

Electric vehicles, while promoted as environmentally friendly, are not entirely carbon neutral, and their

production outside Oregon doesn't benefit our state's economy. We must consider the entire lifecycle

and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy

stability. We believe a one-year lookback period should be incorporated into the regulations to benefit

all covered entities.

Thank you for your commitment to responsible governance and reliable energy stewardship.

---

You don't often get email from lauralisonash@gmail.com. [Learn why this is important](#)

We've run out of time. We don't have the luxury of giving industry any more leeway if we want to stave off climate catastrophe.

I strongly urge DEQ to amend the proposed rules by:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of “book and claim” accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon’s industrial sector has become a reality when we should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you,  
Laura Nash

Hi,

My name is Lynn Handlin and I live in Happy Valley Oregon and work in Portland. I have serious concerns that our climate protection rules are being weakened at a time when they need to be seriously strengthened. We do not have time to mess around with this to benefit big oil and methane and the like at the expense of a livable planet for my kids, and everyone else's kids. Climate change is here, but it is not too late to reduce the impacts so that our future generations at least have a chance. I see trees dying when they shouldn't, my child choking on smoke from extreme wildfires, family members impacted by extreme drought, and on and on.

You have a chance to make things better.

The environmental coalition I work with in Portland OR, primarily on the CEI HUB is very disturbed that DEQ is still utilizing old AP-42 standards written by the oil industry with self-reporting based on the BAER survey. This methodology has been shown to vastly underestimate the amount of emissions by up to 59% and for the Climate Protection Plan to realistically address emission reductions is fully insufficient. Other states utilize the preferred new standards of EPA methods 204 and 325 to replace company guestimates with actual air quality monitoring DATA, emissions inventories, and health assessments. Oregon DEQ should put an end to industry guestimate self-reporting through an industry-stacked methodology.

By undermining the integrity of the CPP, the current proposed rule amendments will severely compromise the program's intended public health, economic, and employment goals, and thereby hinder benefits for Oregon consumers, workers, local economies, and environmental justice communities across the state.

Specifically, I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate and air pollution in Oregon.

I do not understand why aviation fuels and biogenic fuels are also exempted from certain emission reporting requirements, for no particular reason. Also, there's a giant loophole where DEQ can "under unique situations", whatever that means, exempt industry from 3<sup>rd</sup> party verification.

Also, I have serious concerns about missing components to the CI value calculations not being listed "Under OAR 340-215-0042 or 340-272-0455 under the documentation required sections, biofuels and other so-called renewable fuels should not only report on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon intensity numbers.

There must be full transparency about the nature of the fuels including actual information about feedstocks, land use change, processing including what time frame is used to calculate CI of hydrogenation using methane, the shorter time frame of 20 years is much more important in terms of climate than the longer term 100 year time frame, methane is far more harmful in the early years. We do not have time for the 100 year time frame, and more. The rules must ensure that land being used now for growing food, or forest lands that are currently sequestering carbon are not to be used to grow stuff to burn for getting us around.

I do not agree with removing the phrase "additional documentation must be made available for verification upon request". Exporters and transporters of fuels should not be exempted and should have to list the final destination of the fuels(340-215-0115). There is no good reason for this, just more industry give aways. While they may utilize devices to reduce emissions during pumping phases, the open venting to reduce sparking must also be taken under consideration as should potential leakage from during storage and transfers. Any substantive change of use should require a new ACDP or Title V permitting instead of being allowed to operate under old permits.

I have real concerns about who is on this rule making committee, all but 2 of the people are industry representatives of one kind or another, only 2 people with organizations that are defending our environment and who care about environmental justice. That is not a good way to make rules, it's like having the COP led by oil company executives. Please listen to the environmental organizations.

Thank you

Lynn Handlin

**Subject:** Rulemaking Comment: Please Expand Renewable Energy Options  
**Date:** Friday, October 13, 2023 12:41:13 PM

---

Dear Nicole Singh,

As an Oregonian, I'm very concerned about limitations for new renewable energy options in the Climate Protection Program. I urge DEQ to not include geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down. Please do not further increase costs and make this program less effective.

- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon and in fact may limit verifiable carbon reduction.
- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.

Please confirm that DEQ will not include arbitrary and ineffective geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please expand options for decarbonized fuels like renewable natural gas and ensure quantifiable carbon reductions occur as a result of this program.

Sincerely,  
Keith Tilton

As a combat veteran who has deployed and worked around the world one of the advantages we have had as Americans is being partially energy dependent without high taxation and over bias regulation. Right now with the outbreaks of war in our world the last thing we need is more restrictions and rules on our fossil fuels industry. Higher gas prices and availability hurt our Veterans and service members who are on limited income as well as the rest of our great country who struggle every day to make ends meet.

Please think deeply about our state of Oregon, many of us live rural and do have to commute, run our farms and companies each day. Please do not put a strain on our wonderful state and its wonderful people.

I support this letter 100% below

Dear DEQ Team,

I want to share my concerns and thoughts about the proposed changes to the Climate 2023 Rulemaking by DEQ. These changes involve Bio-Methane regulation, Book and Claim accounting, commercial Hydrogen, and the "Lookback" for Covered Entities.

First, it's essential to understand that petroleum-based energy, despite criticism, plays a vital role in Oregon's economy. It not only provides energy but also contributes to economic development and job creation. We should consider the benefits and potential costs of all energy choices, especially in terms of economic impact and human well-being.

During a recent DEQ climate Rulemaking Public Hearing on September 18th, it became clear that some groups have reservations about allowing covered entities in Oregon to use book and claim accounting for Bio-Methane from other states. However, these groups seem to support the use of electric vehicles made outside Oregon and the importation of out-of-state electricity, even without direct economic benefits to our citizens. This creates a difference in standards between Bio-Methane and out-of-state electricity.

We urge DEQ to maintain the current regulations for Bio-Methane without further changes. Book and claim accounting has worked well for using out-of-state Bio-Methane in Oregon's electricity generation. Changing these rules could lead to higher electricity costs, impacting consumers, including those in environmental justice communities. To minimize costs and achieve equity, DEQ should refrain from altering existing regulations. Technological advancements can help with CO2 levels, but economic distress from hasty rule changes cannot be easily reversed.

We believe Bio-Methane should not be subject to geographical constraints for book and claim

reporting. There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas Reporting program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

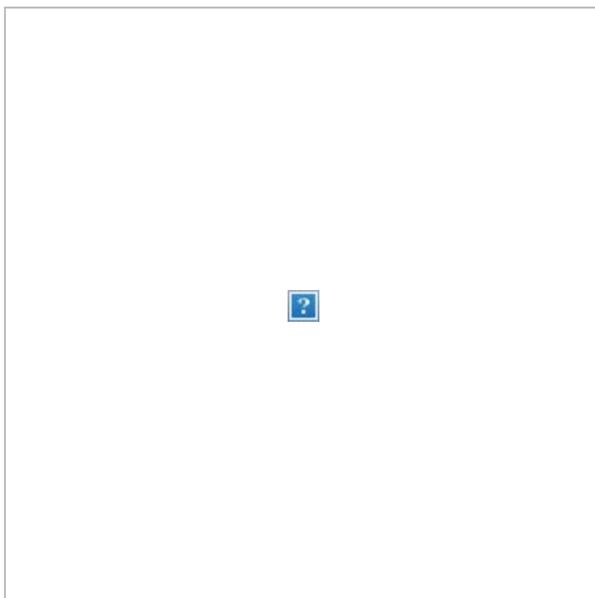

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering. Electric vehicles, while promoted as environmentally friendly, are not entirely carbon neutral, and their production outside Oregon doesn't benefit our state's economy. We must consider the entire lifecycle and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy stability. We believe a one-year lookback period should be incorporated into the regulations to benefit all covered entities.

Thank you for your commitment to responsible governance and reliable energy stewardship.

Sincerely,

**Lee Moore**  
**Sales & Marketing Representative**

Chair George, Vice Chair Baraso, members of the Commission:

My name is Alyssa Koomas and I am a volunteer with Families for Climate. I am a parent to two young children. I am writing this testimony because as their parent, my most essential responsibility is to protect them from harm, and irreversible climate change gravely threatens their future, and the futures of all children in Oregon.

The Climate Protection Program is absolutely critical for Oregon to reduce our climate pollution on the urgent timeline dictated by current science. However, I am deeply concerned that the current proposed rules would undermine the effectiveness of the CPP, and put the necessary emissions reductions out of reach.

Specifically, I am worried that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane offsets, which will hinder the transition to non-emitting alternatives, while failing to deliver direct benefits to Oregonians. I am also worried that the rules as currently written will allow new industrial emitters to produce unrestricted climate pollution in Oregon.

I am asking DEQ to make the following important changes to the rulemaking:

1. **Restrict biomethane (aka renewable natural gas (RNG) and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians.** The stated goals of the CPP are to reduce greenhouse gas emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers, and out-of-state offsets accomplish none of those goals.
2. **Strengthen emissions reduction requirements for new or expanded large stationary source facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.** As the only existing state regulation on major industrial emitters, it is vital that the CPP works to ensure science-based emissions reductions from existing stationary sources and deter development of new stationary sources in Oregon. Given Oregon's growing industrial sector, it is especially critical that DEQ use this rulemaking to strengthen the integrity of the BAER program. Large industrial emitters must be held accountable for their climate pollution.

Oregon families need the Climate Protection Program to live up to its name. Please strengthen the rules so it can protect our children's future, not corporate profits.

Thank you for the opportunity to comment on this rulemaking.

Respectfully,

Alyssa Koomas

A theory is not fact!

Global Warming is based on pure Theory!

Most of which has been debunked!

**Anthropogenic carbon dioxide can't be changing climate, because CO<sub>2</sub> is only a trace gas in the atmosphere and the amount produced by humans is dwarfed by the amount from volcanoes and other natural sources. Water vapor is by far the most important greenhouse gas, so changes in CO<sub>2</sub> are irrelevant.**

**The alleged "hockey stick" graph of temperatures over the past 1,600 years has been disproved. It doesn't even acknowledge the existence of a "medieval warm period" around a.d. 1000 that was hotter than today is. Therefore, global warming is a myth.**

**Global warming stopped in 1998; Earth has been cooling since then.**

**Climatologists conspire to hide the truth about global warming by locking away their data. Their so-called consensus on global warming is scientifically irrelevant because science isn't settled by popularity.**

**Climatologists have a vested interest in raising the alarm because it brings them money and prestige.**

Hello Elizabeth and Nicole:

Happy Friday.

Please see the attached comments to the 2023 Climate Protection Plan rulemaking.

We appreciate DEQ's consideration of these comments.

Please let me know if you have any questions or cannot open the attachment.

Thanks.

**Date:** Friday, October 13, 2023 2:05:56 PM

---

Dear Nicole Singh,

The Strategic Economic Development Corporation (SEDCOR) recognizes the challenges that we face as we collectively work to address climate change and its impacts. As one of our utility partners in our economic development work, NW Natural is a leader in working toward decarbonization, exemplified by its renewable natural gas initiative. But we are concerned about the cost and effectiveness of the Climate Action Program as currently proposed and urge you not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) .

Limiting opportunities for development will decrease supply and ultimately increase costs. Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing the state from meeting our clean electricity goals. Additionally, arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Oregon's processors and manufacturers compete on an international scale; these types of policies ultimately would raise production costs, and the region would quickly become less competitive for future investment.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

Sincerely,  
Erik Andersson

Dear DEQ Team,

I want to share my concerns and thoughts about the proposed changes to the Climate 2023 Rulemaking by DEQ. These changes involve Bio-Methane regulation, Book and Claim accounting, commercial Hydrogen, and the "Lookback" for Covered Entities.

First, it's essential to understand that petroleum-based energy, despite criticism, plays a vital role in Oregon's economy. It not only provides energy but also contributes to economic development and job creation. We should consider the benefits and potential costs of all energy choices, especially in terms of economic impact and human well-being.

During a recent DEQ climate Rulemaking Public Hearing on September 18th, it became clear that some groups have reservations about allowing covered entities in Oregon to use book and claim accounting for Bio-Methane from other states. However, these groups seem to support the use of electric vehicles made outside Oregon and the importation of out-of-state electricity, even without direct economic benefits to our citizens. This creates a difference in standards between Bio-Methane and out-of-state electricity.

We urge DEQ to maintain the current regulations for Bio-Methane without further changes. Book and claim accounting has worked well for using out-of-state Bio-Methane in Oregon's electricity generation.

Changing these rules could lead to higher electricity costs, impacting consumers, including those in environmental justice communities. To minimize costs and achieve equity, DEQ should refrain from altering existing regulations. Technological advancements can help with CO2 levels, but economic distress from hasty rule changes cannot be easily reversed.

We believe Bio-Methane should not be subject to geographical constraints for book and claim reporting. There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas Reporting program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering.

Electric vehicles, while promoted as environmentally friendly, are not entirely carbon neutral, and their production outside Oregon doesn't benefit our state's economy. We must consider the entire lifecycle and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy stability. We believe a one-year lookback period should be incorporated into the regulations to benefit all covered entities.

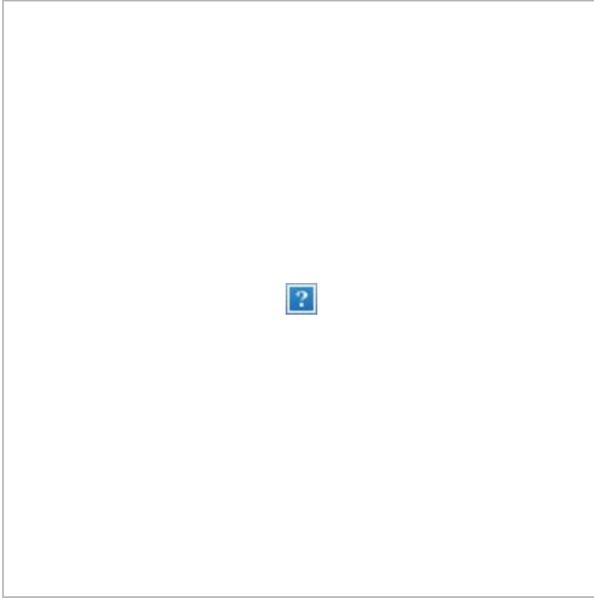

Thank you for your commitment to responsible governance and reliable energy stewardship.  
Sincerely,

**Mary Staub**

Dear Nicole Singh,

As an Oregonian, I'm very concerned about the costs and effectiveness of the Climate Protection Program. I urge DEQ not to further increase costs by imposing geographic limitations on renewable natural gas (RNG) because more opportunities for development will increase supply and drive costs down.

- Arbitrary geographic boundaries simply don't make sense and will increase costs for all Oregonians.
- Arbitrary geographic boundaries for RNG would be akin to excluding wind and solar resources from outside of Oregon, preventing us from meeting our clean electricity goals.
- Arbitrary geographic boundaries do not cut more carbon, and in fact, will limit carbon reduction opportunities.

Please confirm that DEQ will not include geographic limits for decarbonized fuels like renewable natural gas and will allow the use of book and claim accounting methodology under the Greenhouse Gas Reporting Rule.

Please keep costs down and focus this program on quantifiable solutions to address climate change.

My comments: Given the short timeframe global scientists say we have to reduce emissions, it is imperative for the life of all living beings, that these rulings be as strong as possible in line with the goals of the state Climate Protection Plan, instead of fostering business-as-usual or false solutions. I'm disappointed then, to see that the DEQ is not seizing this opportunity-- and accepting your moral responsibility-- to take the strongest possible action. Our lives depend on what we do in the next handful of years.

Here are my specific requests and recommendations:

1. Restricting biomethane and hydrogen used for CPP compliance to that which produces direct benefits for Oregonians, by limiting the eligible use of "book and claim" accounting to only biomethane or hydrogen that is injected into a pipeline within Oregon. Biomass derived fuels should not be allowed exemptions.
2. Strengthening emissions reduction requirements for new or expanded large stationary source facilities in Oregon. Unfortunately, since the adoption of the final CPP rules in 2021, increasing emissions from Oregon's industrial sector have become a reality. We should be holding polluters responsible for decreasing emissions.
3. Maintaining protective restrictions on methane and biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from anthropogenic carbon sources does not comply with the CPP.
4. Including export and transport facilities in emission reduction and reporting standards. Export facilities should have to list their final destinations. While they may utilize devices to reduce emissions during pumping phases, the open venting of railroad cars to reduce sparking must also be taken under consideration as should potential leakage during storage, transportation, and transfers. Any substantive change of site use should require a new Air Contaminant Discharge Permit (ACDP) or Title V permitting instead of being allowed to operate under old permits. Export facilities add to overall global emissions which affect us all in terms of climate chaos.
5. Biofuels and other so-called renewable fuels should not only be reporting on feedstocks and production methodologies, but also on the fuels used for hydrogenation, esterification or other processing to adequately access the true Carbon Intensity numbers. Reporting should also include the land change values necessary to determine what other crops the land could have produced for human consumption as well as associated transportation and fertilizer emissions, and the like for a full picture. Carbon intensity modeling is problematic in numerous ways which is why actual monitoring data and health assessments are preferable.

Thank you for considering these changes, and for doing the right thing by future generations. This is really important. I appreciate your service and the opportunity to comment.

Dear DEQ Team,

I want to share my concerns and thoughts about the proposed changes to the Climate 2023 Rulemaking by DEQ. These changes involve Bio-Methane regulation, Book and Claim accounting, commercial Hydrogen, and the "Lookback" for Covered Entities.

First, it's essential to understand that petroleum-based energy, despite criticism, plays a vital role in Oregon's economy. It not only provides energy but also contributes to economic development and job creation. We should consider the benefits and potential costs of all energy choices, especially in terms of economic impact and human well-being.

During a recent DEQ climate Rulemaking Public Hearing on September 18th, it became clear that some groups have reservations about allowing covered entities in Oregon to use book and claim accounting for Bio-Methane from other states. However, these groups seem to support the use of electric vehicles made outside Oregon and the importation of out-of-state electricity, even without direct economic benefits to our citizens. This creates a difference in standards between Bio-Methane and out-of-state electricity.

We urge DEQ to maintain the current regulations for Bio-Methane without further changes. Book and claim accounting has worked well for using out-of-state Bio-Methane in Oregon's electricity generation. Changing these rules could lead to higher electricity costs, impacting consumers, including those in environmental justice communities. To minimize costs and achieve equity, DEQ should refrain from altering existing regulations. Technological advancements can help with CO2 levels, but economic distress from hasty rule changes cannot be easily reversed.

We believe Bio-Methane should not be subject to geographical constraints for book and claim reporting. There should be no requirements to inject Bio-Methane into an Oregon natural gas pipeline, no restrictions on vintage use for greenhouse gas reporting, and no time constraints. Bio-Methane should be allowed to be claimed and delivered to end-users in Oregon, even if it displaces natural gas used in a connected pipeline.

The book and claim regulations established by DEQ at the start of the Greenhouse Gas Reporting program should remain unchanged. They strike a balance between environmental concerns and our state's energy infrastructure needs.

Hydrogen, especially "Gray" and "Blue" Hydrogen, is a lower emissions alternative worth considering. Electric vehicles, while promoted as environmentally friendly, are not

entirely carbon neutral, and their production outside Oregon doesn't benefit our state's economy. We must consider the entire lifecycle and make informed decisions.

Altering book and claim rules could lead to an energy crisis in Oregon, impacting citizens and energy stability. We believe a one-year lookback period should be incorporated into the regulations to benefit all covered entities.

Thank you for your commitment to responsible governance and reliable energy stewardship.

Sincerely,  
Prabhdip Singh

**To Whom It May Concern:**

Compared to other climate programs, DEQ's price per ton of CO2 is the most expensive in North America. And costs will increase over time as requirements to reduce emissions become more stringent. I believe DEQ should leverage the lowest-cost and most available resources for Oregonians as we decarbonize the gas system over time and not include geographic limits for renewable natural gas projects.

Carbon policy should be clearly authorized by laws and regulations; and those laws, regulations and resulting programs should be effective and as affordable as possible; they should result in verifiable reductions in greenhouse gas emissions; and the impact on consumers should be clearly understood.

DEQ did not analyze the costs, alternative solutions, and economic impacts of their final program design, so no one knows the true cost to Oregonians - at the pump, at the grocery store, in other goods and services, or in their energy bills.

I stand with NW Natural in my belief that the DEQ is working outside its authority in moving forward with this program, that the new program lacks accountability, will be costly for customers and is unlikely to result in all the emission reductions customers will be paying for.

Notable concerns include:

1. DEQ rejected the use of verified offsets as a compliance option, a proven strategy to lower emissions affordably.
2. A significant portion of DEQ's program is based on untested paper credits, referred to as Community Climate Investments, which do not ensure climate benefits attributed to the program actually occur.

These elements are inconsistent with all other carbon regulation in North America and should be fixed.

-Mark

With a 47-year career as an environmental professional, specializing in water and residual solids treatment, I have the education, knowledge and experience to provide comments regarding Climate Protection Rulemaking. The eventual outcomes of DEQs efforts will have broad and impactful implications as they should. Sensible, rational new Rules are paramount to climate protection.

For your consideration, I submit:

Potentially useful methane is produced in municipal and private facilities as a byproduct of wastewater treatment. However, the resulting biogas containing methane is heavily contaminated and of limited value. Biogas cleanup to pipeline quality gas is typically not cost effective onsite at producers' facilities. As a result, most biogas is flared or burned to the atmosphere without treatment releasing other, coproduced contaminants.

I support NWNatural's efforts to recycle and provide pipeline quality treatment of biogas. Recycling biogas will improve the climate by both: 1) the reduction of atmospheric contamination due to flaring of untreated biogas; and 2) providing a replacement for traditional (and additional) natural gas supplies.

To do so quickly and soon the new rules must keep costs down, and incentivize and subsidize, this important climatological and social transition.

Respectfully submitted,

Daniel R Hanthorn

Dear 2023 DEQ Climate Rulemaking,

To whom it may concern,

As DEQ knows well, this rulemaking will have far-reaching consequences for the climate and communities in Oregon. By designing guardrails and pathways for regulated entities to comply with Oregon's cornerstone Climate Protection Program (CPP), this rulemaking – if done well – will be vital to ensuring our state stays on track to achieve our climate goals, and to deliver public health, economic, and employment benefits for environmental justice communities in Oregon.

However, given the broad scope of issues and laws touched by this proceeding, there could be very serious unintended consequences if impacts to communities and the climate are not sufficiently considered. I am concerned that DEQ's current proposed rules would allow regulated gas utilities to rely on out-of-state biomethane investments, and would enable the expansion of new large industrial emitters with the potential to emit unfettered climate pollution in Oregon. The stated goals of the CPP are to reduce greenhouse gas (GHG) emissions and other air pollutants, maximize public health benefits, and minimize costs for consumers in environmental justice and other communities in Oregon, yet these RNG projects deliver no direct benefits to Oregonians. Further, allowing covered fuel suppliers to rely on out-of-state biomethane presents the alarming likelihood that investments will be diverted from the Community Climate Investment (CCI) program, which was designed to provide economic, health and comfort benefits to the communities most in need as well as significant emissions reductions.

I therefore strongly urge DEQ to amend the proposed rules by:

- 1) Restricting biomethane (aka renewable natural gas (RNG)) used for CPP compliance to that which produces direct benefits for Oregonians – projects that reduce pollution in Oregon.
- 2) Disallowing hydrogen to be used for CPP compliance unless it is green electrolytic hydrogen (made from renewable energy sources like solar and wind). Why? Not all hydrogen is created equally. Where and how it is produced and used matters significantly when it comes to emissions reduction – if it's produced from fossil fuels out-of-state, it could be more polluting than even natural gas.
- 3) Strengthening emissions reduction requirements for new or expanded large industrial facilities in Oregon under the CPP's Best Available Emissions Reduction (BAER) program.

I also strongly support maintaining protective restrictions on biomethane accounting in the current rules where they exist, including notably, that synthetic methane derived from human-caused carbon sources does not comply with the CPP. Doing so will not only help ensure that Oregon stays on track to achieve our climate goals, but will also maximize the associated job creation, cost saving, public health, and economic development benefits– ensuring that they

benefit Oregon communities, and are not exported out of state.

Thank you for the opportunity to provide comments.

Sincerely,  
Frances Dunham  
807 Beach Street  
Ashland, OR 97520

Dear Oregon Department of Environmental Quality,

To: Oregon Department of Environmental Quality,

In Dec 2021, the DEQ passed the Climate Protection Program (CPP) to require 50% emissions reductions in Oregon's largest polluting facilities by 2035, and provide direct economic and environmental benefits to communities on the front lines of climate change. I am a long time resident of this state, and I strongly support meaningful, bold steps to mitigate the effects of climate change. The Climate Protection Program is critically important and has strong community input.

However, the recent rule-making table did not include community input, and the results lacked a clear statement of the plan's original goals of reducing greenhouse gas emissions by 50%, providing meaningful investments to benefit Oregonians and holding big polluters accountable.

Therefore, I am calling on the DEQ to adapt the rules for CPP implementation to focus on the original goals of:

- 1) Reducing greenhouse gas emissions and other air pollutants, maximizing public health benefits, and minimizing costs for communities in Oregon.
- 2) Keeping economic and health benefits of the Community Climate Investment program in Oregon: investments should materially benefit Oregonians at the frontlines of pollution and the climate crisis.
- 3) Achieving real reduction of emissions by 50%, rather than allowing companies to invest in biomass-derived fuels that produce methane and use production methods that emit fossil fuels.
- 4) Holding big polluters accountable to engage in science-based "best available emissions reductions" (BAER) from existing stationary sources and deterring development of new stationary sources in Oregon, with accountability including stakeholder and frontline community input.
- 5) Returning the date for a "new source" of stationary pollution to December 31, 2021.

The CPP should facilitate the actual 50% reduction in emissions of all stationary polluting facilities, and Community Climate Investments should benefit those who have already experienced harm from pollutants and who are at most risk from climate impacts.

Now is the time for major action on Climate Change. We need clearly stated goals, plans and timelines. The future of our planet is at stake.

Sincerely,

Pat Kaczmarek

I agree with the position of the League of Women Voters Oregon Climate Emergency Team that changes are needed to close loopholes and guarantee robust emissions reductions.

Therefore the Climate 2023 rulemaking changes should:

- Ensure direct benefits for Oregon communities by only allowing biomethane (aka Renewable Natural Gas) compliance credits for production within Oregon, not from out-of-state.
- Restrict hydrogen for CPP compliance unless DEQ ensures it is green electrolytic hydrogen. Other hydrogen sources and types are far more polluting, with more risks for our energy system.
- Strengthen emissions reduction requirements for industries.

DEQ's program rules need to enforce strong compliance and reporting obligations for regulated gas utilities and industry, to ensure that Oregon can meet its stringent goals for reducing GHG emissions while delivering the maximum public health and economic benefits for Oregonians, especially in underserved communities.

The Climate 2023 Rulemaking should:

- Ensure direct benefits for Oregon communities by only allowing biomethane (aka Renewable Natural Gas) compliance credits for production within Oregon, not from out-of-state.
- Restrict hydrogen for CPP compliance unless DEQ ensures it is green electrolytic hydrogen. Other hydrogen sources and types are far more polluting, with more risks for our energy system.
- Strengthen emissions reduction requirements for industries

I have served on the Climate Action Advisory Board for the City of Corvallis for several years. As a city, we count on the DEQ, DOE and State Legislators to provide leadership and parameters to reduce a large portion of the GHG gasses emitted by our community, knowing that we have roles to play on the local level, as well. Without strong regulations at the state level, we are left with very difficult means to reach our CO2 reduction goals.

Please rise up and resist the influence of the fossil fuel industry.

Thank you.  
Marjorie Stevens

Dear Elizabeth Elbel and Nicole Singh:

Governor Brown took climate change seriously when she signed Executive Order 20-04. However, the rule-making advisory committee on the DEQ's Greenhouse Gas Reporting Program, apparently thinks climate crisis can be willed away with words. Efforts by gas utilities to define out-of-state "Renewable" natural gas (methane) as offsets for in-state natural gas (methane) is down accountability. We need a steep downward trajectory in emissions, not games with numbers. Return to the original Climate Protection Plan.

**RE: 2023 Climate Rulemaking Comments from Concerned Workers and Business Leaders**

We – the organizations that represent highly skilled workers and diverse industries that make up Oregon’s economic engine – appreciate the opportunity to provide public comments on DEQ’s proposed changes to the Greenhouse Gas Reporting Program (Division 215) and the Climate Protection Program (Division 271).

Though our groups represent a wide range of industries and perspectives, we are unified in a common concern about cost impacts to our state’s workforce and families. We urge DEQ to help keep costs down by using the most effective and efficient ways to reduce emissions.

- We support decarbonized fuels – like renewable natural gas – as tools for reducing emissions, including from sources outside of Oregon.
- Decarbonized fuels provide tangible greenhouse gas savings by displacing the use of more carbon intensive fuels, regardless of the end use location or a pipeline connection to Oregon. Reducing emissions anywhere, within Oregon or otherwise, creates a climate benefit everywhere, including for Oregonians.
- Imposing arbitrary geographic limits on where environmental attributes can be procured harms rather than helps Oregonians. This would be akin to excluding wind and solar resources from outside of Oregon – which would prevent us from meeting our clean electricity goals.
- Limitations will increase compliance costs under the Climate Protection Program. As a business operating in Oregon, we are concerned with efficiency and cost. It is important that real carbon reductions are achieved by the Climate Protection Program in the most cost-effective manner.
- Proven and auditable carbon accounting methods are important. The standard book and claim accounting methodology for decarbonized fuel use from across North America provides a mechanism for proper greenhouse gas accounting under the Greenhouse Gas Reporting Rule while controlling costs.

**Please control for costs.**

Increasing decarbonized fuel supply decreases costs, which is why we urge DEQ to be consistent with other carbon markets and programs by **not** arbitrarily including geographic limitation on biomethane and renewable natural gas in the Climate Protection Program and Greenhouse Gas Reporting Rule.

Sincerely,

Edward C Cranston

RE 2023 Climate Rulemaking Comments

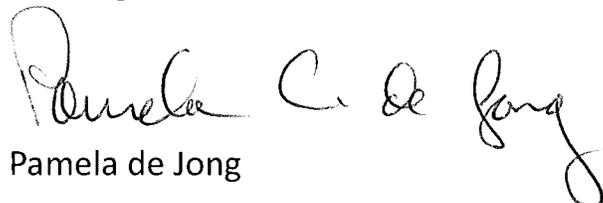

As an individual citizen from North Bend Oregon in Coos County, I am happy to comment on DEQ's proposed changes to the Greenhouse Gas Reporting Program (Division 215) and the Climate Protection Program (Division 271).

I understand we need to reduce our emissions. However, in the process of reducing emissions, we must focus on economic development and jobs as well as cost and cost effectiveness for our communities and families.

Absolutely, I support decarbonized fuels – such as renewable natural gas – as part of how we reduce emissions both within and outside of Oregon. Decarbonized fuels will create a climate benefit everywhere regardless of end use. Any limitations we put on the process, will increase compliance costs which would be detrimental to the program. Using proven and auditable carbon account methods are imperative for both the reporting process and controlling the costs.

***Please center costs, cost effectiveness, and efficiency in your decision making.***

Best regards,

Pamela de Jong

The Douglas County Global Warming Coalition, an all-volunteer grassroots organization representing approximately five hundred members in our community, offers the following comments on the proposed rules regarding biomethane (RNG) and stationary source emissions.

In order to safeguard the integrity and overall intent of the Climate Protection Program, it is essential to reject the use of out of state biomethane as an offset to in-state emissions produced by natural gas companies. Embracing RNG as an alternative to lowering in-state emissions will jeopardize Oregon's ability to meet the emission reduction goals set forth in the Climate Protection Program. It will ensure that Oregonians will bear the brunt of in-state climate pollution. Compounding the problem is the fact that DEQ has limited ability to accurately monitor and verify the actual emission reductions asserted by out of state RNG. In addition, studies conducted by NASA with Duke, Harvard and Brown Universities have demonstrated that the most modest leakage of methane results in this fossil fuel being as detrimental to the climate as coal.

In regards to stationary sources, new and expanded facilities must fall under the same regulatory requirements as existing ones. To allow otherwise creates a loophole which will prevent the Climate Protection Program from meeting its short and long term greenhouse gas reduction goals. These scientifically based targets are essential to Oregon doing its share to address the climate crisis.

The Douglas County Global Warming Coalition strongly urges the DEQ to disallow out of state RNG as an offset to in-state climate pollution and to hold new and expanded stationary sources to the same standards as existing ones.

Sincerely,

The Board of the Douglas County Global Warming Coalition

To Whom it may Concern:

We are all so lucky that we have a Climate Protection Program in the state of Oregon. Thank you for your efforts in this project.

Now, however, we are told that our Climate Protection Program will permit out of state "nonrenewable" natural gas to be used by industrial entities in place of lowering our gas usage. This is unacceptable.

We must not allow states to shuffle gas back and forth so that it "appears" we are using less gas. Overall usage in Oregon and elsewhere, must be reduced.

O V S W

Thus natural gas must never be considered "renewable." Fossil fuels burned anywhere affect the climate everywhere.

Anything else is tantamount to rearranging the deck chairs on the Titanic. There simply cannot be any renewable natural gas if we are to meet our necessary climate goals.

Thank you

William R. Johnson

I am writing to express my strongest concern regarding proposed rules governing biomethane and emissions from stationary sources. The Climate Protection Program is a landmark achievement in the effort to address the climate crisis. However, the proposed rules in these two areas will undermine and severely compromise the integrity of this program.

Specifically, it is imperative to disallow any out of state biomethane (RNG) to substitute for in-state emissions reductions from natural gas. To do otherwise means that Oregonians will continue to suffer the impacts of these dirty emissions. Moreover, by allowing out of state RNG to offset in-state emissions, DEQ is beholden to out of state regulatory entities to measure these emissions. It is critical to recognize that RNG is a dirty fuel and a loophole such as this will undermine the intent of this important program. Further, a recent study by NASA in conjunction with Harvard, Duke and Brown Universities has shown that a leakage of methane as little as 0.2% makes this fossil fuel dirtier than coal - a figure that is easily exceeded. It is true that DEQ has no jurisdiction over leakage; however that is precisely the point. Since DEQ is unable to monitor this source of emissions, it argues even more strongly to reject RNG as an acceptable offset to in-state pollution.

In regards to stationary sources, it is equally imperative to ensure the integrity of this program by holding new and expanded facilities to the same rigorous standards that currently apply to existing ones. To do otherwise subjects this program to an ongoing loophole that will prevent the CPP from reaching its goals essential to bringing the climate crisis under control.

To safeguard the integrity of this program, I strongly urge the DEQ to disallow out of state biomethane as a substitute for in state pollution and hold new and expanded stationary sources to the same standards as existing ones.

Sincerely,

Stuart Liebowitz

Oregon DEQ's Climate Protection Program is a major step forward toward reducing Oregon's CO2 emissions. Two changes to the rules are necessary to ensure the Program's goals are met:

- 1) Natural gas utilities must not be allowed to purchase dubious out of state RNG credits to meet their obligations to reduce their Oregon pollution. They must make investments that benefit Oregonians.
- 2) New and expanding stationary sources must be subject to the same rigorous standards that currently apply to existing industrial sites. Otherwise they pose a threat to achieving Oregon's CO2 emissions reduction goal.

Thank you for your consideration of these changes.

Yours truly,

Dear Elizabeth and Nicole,

I am writing you concerning the need to stop climate pollution in Oregon. Allowing out of state Renewable Natural Gas as a substitute for reducing emissions in our state will undermine the Climate Protection Program and harm Oregonians.

I also urge you to require new and existing industrial polluters to follow the same pollution rules as existing facilities. Thank you -  
Trudy Will

Dear DEQ,

October 10, 2023  
Climate protection plan

Let's steward the land, people, and livelihoods of Oregon by establishing policy that strengthens emissions reduction requirements for new or expanded large industrial facilities, as promoted in the CPP. As a key department in the hands on front line work of setting the policy for a change in how we protect the land, air, and water, I am asking you to ensure that the CPP stays on track to deliver its stated climate goals and public health, economic, and employment benefits for environmental justice in all of our communities in Oregon.

The CPP is the product of a decision making process that considers long term impacts of today's policy choices. As a public school teacher I know the damage and set backs that result from institutional overhauls that are tinkered with before they have enough time to start working effectively.

Now is not the time to change course and capitulate to the short term interests of the oil and gas industry. I implore you to think long term, set policy using the CPP and support it while it begins to create the changes we want to see in the health & welfare of Oregon.

Thank you,  
Amanda Yampolsky
