1.0 Project Overview and Description

This Groundwater Protection Report (Report) was prepared by Apex Companies, LLC (Apex) on behalf of Zenith Energy Terminals Holdings LLC (Zenith) for the Portland Terminal in Portland, Oregon (the Facility). The location of the Facility is shown on Figure 1. The Facility Plan is included as Figure 2. As shown on Figure 3, the Report was prepared to support the proposed Renewable Fuel Project, which is a 13.6-acre subsection of the northeast area of the Facility (the Site). In post-construction conditions, stormwater will entirely infiltrate within the Site; infiltration facilities include engineered swales and infiltration basins. On July 2, 2020, the *Stormwater Management Report* (Apex, 2020b) submitted to the City of Portland presented the calculations using the presumptive approach to demonstrate the effectiveness of on-Site stormwater infiltration.

The Facility is located at 5501 NW Front Avenue in Portland, Multnomah County, Oregon, on Tax Lot 400, Property ID R315845 (Figures 1 and 2). The Facility is used for bulk petroleum product storage, tank car loading and unloading, tank truck loading and unloading, and pipeline shipping and receiving. The Site is bordered to the northwest by the Phillips 66 Portland Terminal, to the northeast by NW Front Avenue, to the

southeast by Kittridge Business Park, and to the southwest by the Burlington Northern Santa Fe (BNSF) railroad tracks. The Facility is zoned as Heavy Industrial and is located in the Willamette Watershed.

The Northwest Portland industrial area historically consisted of a low floodplain and an intersecting series of lakes (Guilds, Kittredge, and Doane). The lakes were filled with dredged material between 1905 and 1930, although a remnant of Doane Lake still exists. Typically, the dredge fill consists of relatively loose sand fills. The project site is within the boundaries of the historical Kittredge Lake.

1.1 Objective

The report objective is to evaluate compliance with two primary performance criteria identified in Oregon rules and statutes for the proposed stormwater infiltration facility. The report will document that operations will not result in pollution of groundwater or impairment of its highest potential use, based on its natural water quality per state and federal groundwater protection rules (OAR Chapter 340, Division 40; OAR Chapter 340 Division 44; Part C of the federal Safe Drinking Water Act). This report will also document that the proposed operations will not exacerbate existing contamination on-site or on adjacent sites per Oregon Revised Statutes (ORS) 465.255.

1.2 Renewable Fuels Project Overview

The purpose of this project is to support renewable fuels (such as renewable diesel derived from soybean feedstock) at the Site. These products will be delivered via railcars, transferred from railcar to existing tanks, and shipped outbound by vessel and truck. Outbound cargos will be transferred from the storage tanks and loaded onto vessels through existing transfer lines. An existing truck rack, within the Zenith terminal, will load out renewable fuel for local distribution.

Marine Operations. A new renewable fuel manifold will be constructed to provide inbound and outbound connections. Intraplant piping will be modified and used to transfer renewable fuel between the new tank manifold and vessels using existing dock lines.

Truck Operations. The renewable fuel will be bottom-loaded at an existing truck rack within the Zenith terminal. A new pump will be installed in the new tank manifold to deliver the renewable fuel to the truck rack.

Railcar Operations. A new epoxy coated concrete containment will be constructed for two separate unloading spots for ten railcars each. The containment will be covered with a canopy on the south unloading rack which will extend five feet beyond the containment curb on all four sides. Stormwater, which is shed off the canopy roof, will be directed to stormwater infiltration areas and contained on site.

The epoxy coated concrete containment is designed to contain the volume of one full railcar with additional capacity for firefighting water per National Fire Protection Association (NFPA) design requirements. Stormwater will not be collected within the containment. Any spills or water in contact with the containment will be pumped to an existing oil/water separator. The contact water will be processed through the existing wastewater system and ultimately sent to the sanitary sewer. Stormwater which falls within the project area will infiltrateinto the project area soils or will be directed to infiltration ponds.

Two new rail rack structures will be installed to provide access to the top of the railcars. A retractable safety access platform will be provided at each railcar load spot.

The current ground elevation at the Site ranges from 35 feet to 40 feet above mean sea level (MSL) and is predominantly a gravel surface. Development at the Site will include construction of the infiltration facilities described in this report at elevations of 34 feet MSL and higher. The proposed soil removal volume associated with this work is 22,625 cubic yards (yd^3), and the approximate fill volume is 8,685 yd^3.

In post-construction conditions, stormwater will infiltrate into the Site soils. Infiltration facilities include engineered swales and infiltration basins. A *Stormwater Management Report* (Apex, 2020b) submitted to the City of Portland on July 2, 2020 presented the calculations using the presumptive approach to demonstrate on-Site stormwater infiltration.

2.0 Background

A discussion of the Site physical and geologic setting, depth to water, Site and vicinity land use, Site use history, and Site and vicinity environmental investigations is provided below.

2.1 Physical and Geologic Setting

The Site includes approximately 31.3 acres of land improved with 97 above-ground storage tanks (ASTs) and 18 buildings with a total footprint of approximately 48,600 square feet (SF). The Site is underlain by fill and quaternary surficial alluvial deposits, and is at an elevation of approximately 40 feet MSL. The Site is located within the Portland Basin, in the Willamette River floodplain. The Site is bounded to the southwest by a steep bedrock escarpment consisting of Columbia River Basalt, and to the north and east by the Willamette River. The Portland Basin is filled with alluvium and Pleistocene flood deposits and underlain by Holocene to Eocene sedimentary and volcanic rocks. Soil conditions consist of urban land, with 0 to 3 percent slopes.

Groundwater is encountered at the Site at depths ranging from approximately 4 to 22 feet below the ground surface (bgs). Groundwater gradients have been measured at magnitudes between approximately 0.02 and 0.04 feet/feet on-site. Shallow groundwater flow has been documented towards the north/northeast towards the Willamette River based on historical groundwater monitoring activities.

The Site is located within 600 feet of the Willamette River; however, no state inventoried wetlands are on or adjacent to the Site. The Site was formerly the location of the historical Kittridge Lake. During the early 1900s, the lake was filled with dredge spoils from the Willamette River. The results of a subsurface exploration conducted in 1985 indicate that the central portion of the Site and the northern yard are generally underlain by 5 to 15 feet of loose to medium dense sandy fill overlying sandy silt and silt. Soil underlying the southern two-thirds of the southern yard consists of loose sandy silt and silty sand. The first occurring groundwater has been observed within the fill material and Holocene sediments.

The project area is underlain by silt and sand fill to approximately 20 feet bgs. The observed fill in the project area consists of laterally and vertically discontinuous layers of medium brown, poorly graded sand, silty sand, and silt.

2.2 Depth to Groundwater

This section summarizes installation of monitoring wells and groundwater elevations in the vicinity of the proposed infiltration facility. Groundwater monitoring well locations are shown on Figure 2.

Groundwater monitoring has been conducted periodically since the installation of these monitoring wells. During each event, depth to water was measured at each well to the nearest 0.01 foot using an electronic oil/water interface probe. Upon arrival at each location, the covers were opened to allow the groundwater levels to equilibrate in response to ambient atmospheric pressure.

The well installation date, total depth, screen interval, number of gauging events, and range of groundwater elevations observed is summarized below.

- In 1993, monitoring well A-10 was installed. The well was installed to a depth of 17.5 feet with a screened interval of 7 to 17.5 feet bgs. Since 1993, the groundwater elevations in well A-10 have ranged from 23.37 to 27.22 feet MSL over a total of 45 monitoring events.
- In 1994, groundwater monitoring well U-South was installed to a depth of 18 feet with a screened interval of 8 to 18 feet bgs, and U-North was installed to a depth of 20 feet with a screened interval of 10 to 20 feet bgs. Since September 2000, groundwater elevations have ranged from 22.56 feet to 25.50 feet MSL during 37 events in both wells.
- In June 2009, monitoring well W-30 was installed; the well has a total depth of 25 feet with a screened interval of 5 to 25 feet below the ground surface. Since September 2009, groundwater elevations in well W-30 ranged from 24.30 feet to 26.02 feet MSL during seven events.

The data summarized above indicate that the groundwater elevations observed in monitoring wells at the Site since 1993 provide adequate vertical separation between the base of the proposed infiltration facilities (34 feet MSL) and groundwater (highest groundwater elevation measured was 27.22 feet MSL) – a minimum

separation of 6.78 feet. The average groundwater elevation in the four wells during 126 gauging events conducted during a period from August 1993 through March 2020 was 24.69 feet MSL – an average vertical separation of 9.31 feet from the proposed infiltration facility.

2.3 Site and Vicinity Land Use

There are six main operational areas at the Site (see Figure 2), all located west-northwest of the proposed Renewable Fuels Project area. These areas include:

- **Front Tank Loading**: Located in the north-central portion of the facility, encompasses 0.64 acres and contains 20 ASTs.
- **Distillation Area**: Located directly south of the front tank loading area, encompasses 0.87 acres and contains two ASTs (T-314 and T-161), a distillation column, furnaces, a boiler room, a control room, and laboratory space.
- **Crude Tank Area**: Located on the west side of the facility and encompasses 9.6 acres. This area contains 20 ASTs that previously stored crude oil, asphalt, slop oil, naphtha, charge stock, and kerosene. Currently, Tank 105 is used to store petroleum products, and the remaining tanks hold residual bottoms from previous operations. The on-site wastewater pre-treatment facility is located in this area.
- **Guilds Lake Tank Farm**: Located in the southwestern portion of the facility and encompasses 12 acres. This area contains 15 ASTs that previously stored asphalt, crude oil, charge stock, aviation gasoline, and naphtha. Currently Tank 106 is used to store petroleum products, and the remaining tanks hold residual bottoms from previous operations.
- **Emulsions Area**: Located in the central-eastern portion of the facility and encompasses 2 acres. This area contains 40 ASTs, 2 cooling towers, the facility's warehouse, and three loading racks. The tanks currently hold residual bottoms from previous operations but are not in current use.
- **Railcar Loading and Unloading Area**: Located adjacent to the warehouse in the eastern portion of the subject property. Activities include loading and unloading petroleum products.

Containment for the on-site ASTs consists of concrete walls and earthen berms. No underground storage tanks (USTs) are present. Additionally, eight truck loading racks and one rail car loading rack are present at the Site (Figure 2). Product is transferred from the tank yards through dedicated above-ground piping. The Site has approximately 590,000 SF of paved roadways, rooftops, and tank tops that drain into the stormwater drainage system.

Current operations at the Site include bulk petroleum product storage, tank car loading and unloading, tank truck loading and unloading, and pipeline shipping and receiving to the Chevron Dock located approximately ¼ mile to the north-northeast, across Front Avenue. Additional operations at the Site include a steam system that is powered by three natural gas-fired boilers, a maintenance shop, and an equipment warehouse. The

Site houses 97 product storage tanks with a containment capacity of 1.7 million barrels (bbls), and handles an average of approximately 362,000 bbls per month of petroleum products. A 12,000 bbl/day refinery is located on-site; however, the refinery has not been operated since September 2006. Approximately 10 of the bulk storage ASTs are currently out of service.

Asphalt, crude oil, and vacuum gas oil are received and shipped out by barge, ship, railcars, and tanker trucks. Loading and unloading of barges and ships is performed via pipeline at the Chevron Dock. The steam system at the Site is used to heat tanks containing products which solidify at ambient temperature (*i.e.* vacuum gas oil and asphalt). Maintenance, cleaning, and repairs of terminal equipment are typically performed at the maintenance shop. Spare parts and equipment are stored in the equipment warehouse.

Adjacent properties consist of heavy industrial and commercial operations, and include the Phillips 66 terminal to the north-northwest, BNSF railroad tracks to the west, a business park to the southeast, and McCall Oil and Chemical Corporation and CalPortland to the east across NW Front Avenue.

2.4 Site Use History

The Willbridge Asphalt Refinery was constructed on a portion of the Site in 1947 and was in operation through the end of 2013. From 1945 to 1951, the Site was owned by California Asphalt Corporation. From 1951 to 1973, the Site was operated by three entities: the refinery was operated by Standard Cal Asphalt and Bituminals, the tank farm was operated by Standard Oil Company, and a small lot was operated by Signal Oil Company. From 1973 to 2005, the Site was operated by Chevron Products Company Asphalt Division. From 2005 to 2014, the Site was operated by Paramount Petroleum Corporation. Site operations during these historical uses consisted of asphalt refining, emulsions manufacturing, and asphalt blending. Products produced consisted of asphalt emulsions, asphalt, modified asphalt emulsions for roofing products, vacuum gas oil for gasoline refinery feedstock, kerosene, naphtha, and middle distillates. Approximately 200,000 bbls of crude oil were processed monthly. At the end of 2013, the asphalt refinery ceased operations. In January 2014, Arc Terminals Holdings, LLC purchased the Site. In December 2017, Arc Terminals merged with Zenith Energy Terminals Holdings, LLC. Since 2013, the Site has operated as an oil terminal.

The undeveloped southeast portion of the Site, where the Renewable Fuels Project area is proposed, historically consisted of shipyard worker housing during World War II and has been vacant since the war ended. This portion of the Site has also been used periodically for the storage of equipment and vehicles.

Crude oil, charge stocks, and bulk compounding stocks for the refining process were received by tanker shipments at the Chevron Willbridge Distribution Center dock (located at 5924 NW Front Avenue) and by tank car or transport trucks. Crude oil and light petroleum products were transported to and from the Site to the Chevron dock via aboveground and underground pipelines. Asphalt, vacuum gas oils, fuel oil, and naphtha

are shipped by barge and tanker from the Willbridge Distribution Center dock, as well as by tank car, pipeline, and tank truck from the Site.

Caustic soda and hydrochloric acid (HCl) were historically stored in ASTs in the refinery and emulsions tank yard area (see Figure 2). These materials were used in the manufacturing of emulsified asphalt. Each AST is within a dedicated secondary containment area separated by a concrete wall that has been treated to resist high and low pH materials in the event of a spill. Containment basins drain to an on-site oil/water separator. A tank of caustic soda was located next to the emulsions warehouse and was used to raise the pH of wastewater discharging to the publicly owned treatment works.

Historically, ferric chloride was used in manufacturing at the Site. Additionally, polychlorinated biphenyls-(PCB) containing transformers were present historically on-site; they were removed prior to 1996 and their former locations are unknown.

The Site was formerly a small quantity generator (SQG) of hazardous wastes. Historically, wastes were stored west of tank T-100 and in the maintenance warehouse (see Figure 2).

2.5 Environmental Investigations - Site

Regulatory History. The US Environmental Protection Agency (EPA) conducted a preliminary assessment at the Site in 1983. A No Further Remedial Action Planned designation was issued by EPA in 1984. In 1994, Chevron signed a letter agreement with the Oregon Department of Environmental Quality (DEQ) and the Site was transferred into the DEQ Voluntary Cleanup Program (VCP). In 1995, Chevron terminated the VCP letter agreement to independently conduct site investigations. In 2002, DEQ prepared a strategy recommendation for the Site, and recommended conducting an expanded preliminary assessment. Chevron signed a DEQ VCP letter agreement and conducted the expanded preliminary assessment, which was submitted in 2004. A source control decision document was issued for the Site in 2010. Lastly, a removal action was conducted under the VCP program in 2011 related to a naphtha release. Figure 2 shows the historical documented release locations; the releases were not documented to be located on the undeveloped portion of the Site where the Renewable Fuels Project area is proposed.

Soil. Soil investigations were conducted at the Site in 1993 and 1994 by SEACOR. Petroleum hydrocarbons were detected sporadically in collected soil samples on the western portion of the Site. Detected total petroleum hydrocarbon (TPH) concentrations ranged up to 36,000 milligrams per kilogram (mg/kg). Polycyclic aromatic hydrocarbons (PAHs) were also detected in Site soil; however, most detections were below the USEPA Region IX Preliminary Remedial Goals (PRGs). Detected metals concentrations were reported to be within the range of expected naturally occurring concentrations. Small areas of asphalt are occasionally observed at the surface near Tank 102 in the Crude Tank Yard. This material is residual from an asphalt boil-over in 1957.

In 1994, a soil investigation was conducted by SEACOR on the undeveloped lot, where the Renewable Fuels Project is proposed. A total of 20 soil borings were advanced, three monitoring wells were installed, and surface soil samples were collected. Petroleum hydrocarbons were not detected in the collected soil samples.

An expanded preliminary assessment was conducted in 2003 under DEQ oversight. A total of 10 soil borings were advanced and 28 soil samples were collected and analyzed for TPH, PAHs, volatile organic compounds (VOCs), pesticides, and metals. Most of the detected concentrations were below risk-based concentrations (RBCs) for human health and DEQ did not require additional investigation.

Nine additional soil borings were completed on-site in 2009 to investigate separate phase hydrocarbons (SPH) near wells W-14 and W-28. There were no visual observations of soil staining or SPH in the borings other than elevated photoionization detector (PID) detections in two borings. No soil samples were collected for laboratory analysis.

Figure 4 depicts known soil sample locations and results near the proposed Renewable Fuels Project Area. All collected soil samples to date within the proposed project area have been non-detect for benzene, toluene, ethylbenzene and xylene (BTEX) and TPH.

Groundwater. Three series of monitoring wells were installed at the Site in 1985, 1993, and 1994. In 2006, two wells were installed as additional monitoring locations and two wells were replaced. In June 2009, two additional monitoring wells were installed. There is a total of 30 monitoring wells located on-site, and the monitoring wells have been gauged and sampled periodically since installation. Petroleum hydrocarbons have been detected in: the southern area of the Crude Tank Yard; adjacent to the oil collector in the Guilds Lake Tank Yard; the vicinity of the refining/distillation area; the area between Tanks 100 and 101; the area east of Tank 100; and the area north of Tank 66. The highest benzene concentration was detected at 700 parts per billion (ppb). Elevated concentrations of PAHs were also detected. Arsenic and barium were detected in most of the groundwater samples.

BTEX concentrations in groundwater have decreased significantly at the Site since initial sampling was conducted. During the March 2002 sampling event, the only BTEX detection was 17 ppb of benzene detected at well W3, located near the property boundary along Front Avenue. The only PAH detection was 5 ppb naphthalene for well A2, located in the Crude Tank Yard. Trace concentrations of several other VOCs were detected in the samples collected from wells W-3, W-4, A-1, and A-2.

SPH have been measured in monitoring wells in the central area of the Crude Tank Yard, between the Crude Tank Yard and the Shipping Tank Yard, near the Distillation Area and laboratory, near the southwestern property boundary, and adjacent to the oil collector in the Guilds Lake Tank Yard. SPH fingerprint analysis was conducted in 2001 and identified three distinct plumes from historical spills or releases. The SPH was confirmed to be consistent with the petroleum hydrocarbons stored or used at the Site. An SPH monitoring program was implemented in October 2001. From 2001 to 2005, select monitoring wells were gauged

monthly, and minor volumes of SPH have been recovered. An SPH removal pilot test was conducted in 2009 at 4 monitoring wells by using a vacuum truck to remove SPH from each well casing. It was concluded that the vacuum truck did not significantly enhance SPH recovery or provide a long-lasting solution. The encountered SPH is viscous; therefore, its mobility and potential for off-site migration is considered low by DEQ. Periodic well gauging activities were conducted at the Site between 2013 and the present.

Figure 5 depicts known monitoring well sampling locations and results near the proposed Renewable Fuels Project Area. In general, concentrations of BTEX, TPH, and PAHs are non-detect in the proposed project area. TPH was detected in 1993 at a low concentration (600 micrograms per liter [µg/L]) in well W-12 just outside the project area to the west; however, more recent sampling events have been non-detect. Diesel-range TPH (TPHd) was detected in well W-29 just outside the project area to the west, at concentrations up to 4,850 µg/L in 2009 and 2010. TPHd was also detected in grab groundwater samples collected from borings in this area in 2009, up to 87,700 µg/L.

On July 20, 2020, groundwater samples were collected from wells U-North and U-South. The well locations are on the northeast side of the proposed infiltration facility and are shown on Figure 3. Samples were submitted to Apex Laboratories for the following analyses: dissolved metals; TPH as diesel, gasoline, and oil-range organics; PAHs; and VOCs. As shown on Table 1, only one constituent (anthracene) was detected in the samples. The anthracene detection in the groundwater sample collected from U-South was less than the applicable RBCs.

2.6 Environmental Investigations – Site Vicinity

An ERIS database was obtained and reviewed to identify hazardous substance release sites within the Site vicinity. The ERIS report is included as Appendix B. Figure 6 was prepared to depict the identified release sites. A summary of release sites within approximately 1,000 feet of the proposed infiltration area is provided below. Additional release sites outside this radius are documented within the ERIS report in Appendix B.

Great Western Chemical, 5540 NW Front Avenue, LUST #26-89-0173. The adjacent property to the north-northeast, Brenntag Pacific Inc. / Chemax / Quadra Chemicals Western Inc. / Great Western Chem / Nalco Chemical (5700 / 5724 / 5540 NW Front Avenue), was identified as a cleanup site and organic chemical manufacturer. Numerous spills and incidents were reported between 1995 and 2003. A leaking underground storage tank (LUST) case was reported in 1989, and soil cleanup was conducted in 1990. The site received a no further action (NFA) determination from DEQ in 2015. This facility is downgradient of the Site.

Glacier Northwest / Tube Forgings of America / Front LP Properties, 4950, 5034, and 5200 NW Front Avenue, ECSI #1239, 2378. The adjacent property to the east-northeast, Tube Forgings of America, Inc. (5200 NW Front Avenue), was identified as a cleanup site. The adjacent properties to the east-northeast at 4950, 5034, and 5200 NW Front Avenue were also collectively identified in the Environmental Cleanup Site

Information (ECSI) and VCP databases due to a sediment study related to the Portland Harbor Superfund Site and were reported to be related to Tube Forgings. The property at 5034 NW Front Avenue was further identified as Glacier Northwest, Inc. / Front Ave Ready-Mix Plant as a cleanup site. Sampling results from the Portland Harbor Sediment Study identified metals, 4-methylphenol, and benzoic acid in river sediments adjacent to this site. The elevated metals were reported to possibly be connected to imported slag aggregate related to the Oregon Steel site, formerly at this location. The LUST database also identified this site as Zidells. The site status is listed as 'cleanup completed' as of September 2019 and groundwater was reported to be formerly impacted with heating oil. This property is downgradient of the Site.

Hampton Lumber Sales, 4950 NW Front Avenue, ECSI #5761. The adjacent property to the east-southeast, Hampton Lumber Sales Inc. / Tri Con Forest Products, was identified in the ECSI and VCP databases, which documented that the property entered a voluntary agreement with DEQ in October 2012 to perform a stormwater source control on-site. As of April 2016, the stormwater source control workplan was submitted and the facility began sampling per the work plan. A release of diesel from a leaking tank was reported for this site in 1989; the spill was cleaned up and an affected storm drain was flushed per DEQ instruction. In addition, a LUST record was identified for this facility on the Oregon ECSI database website. Two USTs were decommissioned in 2018 and petroleum hydrocarbon impacts were observed in soil and groundwater. Concentrations of TPH were detected below the selected DEQ RBCs, and a light non-aqueous phase liquid (LNAPL) sheen was observed. As of a report dated April 30, 2018, additional assessment is planned, including installing groundwater monitoring wells, collecting a soil gas sample, and conducting additional soil assessment. This facility is downgradient of the Site.

Shaver Transportation, 4900 NW Front Avenue, ECSI #2377. The property to the east, Shaver Transportation (4900 NW Front Avenue), was identified as a cleanup site. Since 1956, the site was the operational headquarters for Shaver Transportation, which operated a shipping business using tugboats and barges. Various lubricating oils, fuels, paints, and solvents have been used at the site. Based on initial sampling results from a river sediment quality study, the Shaver property was identified as a potential source of contamination to the Portland Harbor. In 1992, a release was discovered during decommissioning of two 10,000-gallon diesel USTs. Impacted soil was excavated and sampled soils detected residual diesel contamination up to 230 ppm. A petroleum release also occurred in 1994 during the filling of an AST. Impacted soils were excavated; no confirmation samples were collected. An Expanded Preliminary Assessment is currently being completed under a voluntary agreement to sample sediment and evaluate operational history to determine if the site has contributed metals contamination to the adjacent sediment. Based on review of available information, DEQ determined that the upland site area poses no significant threat to human health or the environment and issued a no further action in 2003.

Lakeside Industries, 4850 NW Front Avenue, ECSI #2372. This property is a Portland Harbor Upland Source Control site. Lakeside operates a hot mix asphalt plant on-site, and investigation was conducted for VOC and oil groundwater impacts. In the early 2000s, sampling results from the Portland Harbor Sediment Study revealed metals, semi-volatile organic compounds (SVOCs), and VOCs in sediment adjacent to the

site. DEQ required groundwater assessment activities, and VOCs were detected in site monitoring wells. In 2014, a source control evaluation was completed, and DEQ requested additional groundwater monitoring and resubmittal. A revised source control evaluation was submitted in November 2019 which documented buried petroleum on-site along the shoreline bank. The report also documented that groundwater is not impacted downgradient of the buried petroleum and does not appear to be impacting Willamette River sediment. Lakeside requested a source control decision and indicated that source control measures are not warranted because the site is not a current or likely future source of impacts to the Willamette River.

BDC Properties, LLC, 4927 NW Front Avenue, ECSI #2454. The property to the east/southeast, BDC Properties, LLC (4927 NW Front Avenue), was identified as a cleanup site. This site was reported to be used since 1968 for metal recycling activities, primarily copper, aluminum, and lead recovery from coated wires. Calbag has operated at the site since 1995. Wire coatings and insulation were separated from the wire using an incinerator that generated a significant volume of ash. The operations were generally conducted under hazardous waste, air emissions, and water discharge permits. Calbag ceased operations in 2000. A subsurface investigation confirmed that three USTs on-site decommissioned in 1987 are not sources to contamination in the Willamette River. Sampling results from the Portland Harbor revealed elevated levels of barium, cadmium, lead, mercury, and zinc in Willamette River sediments adjacent to the site. Historical site data indicated that the site was a potential source of metals, PCBs, and phthalates to the Willamette River. In 2005, the site achieved a source control decision of no further action. Data collected by the City of Portland in 2007 and 2008 indicated that PCBs may be migrating from the site into stormwater. The new property owner, BDC Properties, LLC, entered into an agreement with DEQ in 2009 to conduct a source control evaluation for the stormwater pathway for the site. Work plans for investigation were approved and iterative sampling, implementation of source control measures, and effectiveness monitoring were conducted. The site obtained coverage under the 1200Z Industrial Stormwater general permit in 2019. DEQ is currently preparing an amendment to the 2005 source control decision.

Kittridge Distribution Center, 4959 NW Front Avenue, ECSI #2442. The Kittridge Distribution Center (4959 NW Front Avenue) adjacent to the Site to the south was identified as a cleanup site and as a potential source of impacts to the Willamette River based on sampling results from a river sediment study, via impacted groundwater and/or stormwater discharge to city outfalls. Site soil and groundwater were reported to be impacted with metals, PCBs, TPH, and VOCs due to a historical acetylene plant that operated on-site between 1942 and 1985. In 2004, DEQ determined that this facility was a low priority for further action. DEQ issued a conditional NFA for this site in March 2007. This facility is slightly upgradient / crossgradient from the Site; however, identified impacts have not been reported to migrate off-site, and a conditional NFA is in place.

Willbridge Yard, ECSI #3395. This BNSF switching yard and staging and loading area for railroad cars is located between NW Doane and Kittridge, and the NE side of St. Helens Road. Contamination is listed as suspected due to possible releases during loading and unloading activities, refueling, and storage tank leaks. A small diesel spill was also reported in 1995. An Expanded Preliminary Assessment Report was submitted in 2011. Multiple instances of investigation, sampling, control measure implementation, remediation, and

performance evaluation were conducted. Contaminants of potential concern included TPH, PAHs, and metals. In 2015, a source control evaluation was initiated for the groundwater to stormwater pathway. In a 2017 Portland Harbor source control decision memo, DEQ concluded that the site is adequately characterized to support a source control decision, and source control measures are not warranted. The property was reported to not be a current or reasonably likely future source of contamination to the Willamette River.

AB Properties / Lend Lease Trucks, 4621 NW St. Helens Road, LUST# 26-05-2479, 26-90-0509, 26-92-0239. A leaking diesel UST was reported for this site in 1990; an NFA was received in 1991. A leaking petroleum UST was reported for this site in 1992; a cleanup was completed and an NFA was received in 1997. A leaking heating oil UST was further reported for this site in 2005. A cleanup was completed and an NFA was received in 2007.

Anderson Portland Properties, 4500 Block NW St. Helens Road, ECSI #5529. PCB-impacted soils were identified at this site in the 1990s, originating from undocumented releases associated with transformer reclamation. Following excavation activities, DEQ issued an NFA for Tax Lot 100 in 2001. Additional impacted soils were detected on Tax Lot 200 and were characterized and removed in 2011. Residual contamination was reported to be below acceptable risk levels and the DEQ issued an NFA for the site in 2014.

PGE, 4400 Block NW St. Helens Road, ECSI #2406. An independent cleanup was conducted at this site by Portland General Electric (PGE) in 1999. PGE determined that site soils were impacted by PCBs and excavated approximately 1,800 tons of impacted soil. Residual PCB concentrations in site soil were reported as not exceeding the cleanup level of 1.2 ppm. DEQ provided a no further action status for the site in 2001.

Brazil & Co., 4315 NW St. Helens Road, ECSI #1026. This site was added to DEQ's database in 1990 due to previous site uses for sandblasting and sale of electrical equipment. As part of the Portland Harbor upland source control site discovery efforts, the City of Portland collected and analyzed catch basin sediment and stormwater in City conveyances originating on the Brazil site from 2003 to 2012. Sampling efforts indicated that PCBs may have been discharged into the City conveyance system above screening levels. In 2010, Brazil entered into a VCP agreement with DEQ to complete a source control evaluation at the site. Additional contaminants of concern included PAHs, metals, and phthalate esters. Elevated levels of metals were detected during investigation activities and impacted soils were removed. Following remedial action activities, three sample points still exceeded RBCs for arsenic and PCBs; however, DEQ concluded that the impacts were spatially limited and that the removal action was protective. DEQ granted a no further action status for this site in 2016 and issued a Source Control Decision, which concluded that the site was adequately characterized and is not a current or reasonably likely future source of impacts to the Willamette River.

Mt. Hood Chemical, 4488 NW Yeon Avenue, ECSI #1328. This site was historically used for bulk chemical storage and distribution, as well as for transport and storage of hazardous wastes (mostly chlorinated solvent wastes). Chemical storage and handling activities ceased in 1986, and in 1990 a Resource Conservation and

Recovery Act (RCRA) Facility Closure Plan was implemented. Site soils were investigated and concentrations were not detected above acceptable risk levels. In addition, inspections of the concrete surfaces found that no cracks had penetrated the surface, and collected concrete core samples contained no significant contamination. The DEQ issued an NFA for the site in 1995.

Dura Industries, 4466 NW Yeon Avenue, ECSI #111. This site has received notices of violation for improper hazardous waste management practices. In 1990, soil samples were collected and low levels of contamination were identified (cadmium and chromium). The site status is currently listed as 'contamination suspected', and a site screening is recommended by DEQ.

Mt. Hood Chemical, 4444 NW Yeon Avenue, ECSI #81. DEQ performed a Federal Preliminary Assessment for this site in 1984 that concluded that manufacturing cleaning compounds at the property did not result in the generation, treatment, storage, or disposal of hazardous wastes at the site. In 1992, the EPA made a no further remedial action proposal (NFRAP) decision for the site. In 2007, a limited subsurface investigation conducted for the site identified halogenated VOCs in site groundwater and soil, with some concentrations above DEQ RBCs. The site entered into DEQ's Voluntary Cleanup Program to complete remedial investigation and implement any necessary source control measures. Since 2007, multiple investigations have been conducted as well as removal actions to address the presence of contamination at the site. In 2019, a Revised Source Control Evaluation was submitted to DEQ for the site. A draft source control decision by DEQ was issued in March 2020 and indicated that the stormwater pathway is complete; however, monitoring confirms that source tracing and source control measures have effectively minimized contamination leaving the site via the stormwater pathway. The document further indicated that site groundwater contains exceedances of VOCs, PAHs, arsenic and cadmium. DEQ concluded that the site is adequately characterized and contamination does not pose significant risk to the Willamette River.

Anderson Brothers Property, 5275 & 5315 NW St. Helens Road, ECSI #970, LUST #26-88-0115. This site is heavily vegetated and has never been developed. However, soil was found to be impacted with PCBs, likely from equipment stored on-site by one or more adjacent property owners. Investigation was completed in 2009 and 2010, and in 2011 approximately 640 tons of PCB-impacted soil was removed. Groundwater was not encountered. DEQ conducted a source control evaluation and concluded that sources of contamination have been identified and controlled and do not pose a threat to the Willamette River. DEQ issued a No Further Action for the site in 2014.

Unocal Willbridge Terminal, 5528 NW Doane Avenue, ECSI #177 / 1549. The Phillips 66 Terminal / Willbridge Terminal / Tosco adjacent to the Site to the west-northwest has had numerous large spills reported between 1988 and 2016 and environmental violations reported between 1999 and 2004. A leaking diesel UST was reported in 1994 and the cleanup project was closed in 1997. The terminal was identified on the ECSI database with investigations initiated in 1988 and an investigative status of 'suspect'. Multiple investigations are listed for petroleum products releases in groundwater. A portion of this facility is upgradient from the Site.

Chevron Willbridge Terminal, 5531 NW Doane Avenue / 5924 NW Front Avenue, ECSI #25, 160, 177, and 1549. This site is located north-northwest of the Site and is a reported cleanup site. Numerous spills have been reported at this site between 1973 and 2016. Past activities at the site, including spills, tank bottoms burial practices, leaking USTs, and leaky petroleum transmission lines allowed petroleum products to permeate site soils and accumulate at the top of the shallow aquifer. Multiple prior investigations are reported for petroleum products releases to groundwater. A network of recovery wells was reported to intercept the flow of hydrocarbons to the Willamette River. This facility is downgradient of the Site.

McCall Oil, 5480 / 5550 NW Front Avenue, ECSI #134. The adjacent property to the northeast, McCall Oil / Cascade has had numerous spills reported between 1988 and 2017 that are listed as remediated. The facility was listed as having a confirmed release and a conditional NFA determination granted in 2002. Investigations conducted included soil, groundwater, and sediment sampling. VOCs, SVOCs, and metals impacts were identified and remediated. This facility was also listed as part of the Portland Harbor sediment investigation related to the superfund site. In addition, soil impacted with copper and arsenic was detected in 1991 and removed. Ongoing remedial investigation activities are being conducted to evaluate potential off-site migration and further delineate contaminants in groundwater. This facility is downgradient of the Site.

3.0 Existing System

This section describes the existing stormwater and wastewater systems on-site.

3.1 Stormwater System

The overland flow of stormwater to the Willamette River does not occur at the Site. Stormwater either infiltrates at the Site or is discharged from the Site through two municipal stormwater line systems. The Stormwater Valve 39 (SWV-39) stormwater system collects surface water from Area 1 (the Guilds Lake tank yard), directs it through a shutoff valve designated as SWV-39, and exits the Site to the east. Figure 7 shows the stormwater system. This stormwater ultimately discharges to the City of Portland Outfall 19, southeast of the Site, and the Willamette River. The SWV-33 stormwater system collects stormwater from Areas 2, 3 and 4, directs it through a shutoff valve vault designated as SWV-33, and exits the Site to the northeast along Front Avenue. This stormwater ultimately discharges to the City of Portland Outfall 22, located northeast of the Site, and the Willamette River. The stormwater vaults at SWV-39 and SWV-33 are the Site's designated National Pollution Discharge Elimination System (NPDES) stormwater discharge sampling locations. The facility has operated under an NPDES permit since 1992. Figure 2 shows the stormwater basins at the Site, which include the following:

- Area 1: Guilds Lake Tank Yard
- Area 2: Equipment Storage and Parking
- Area 3: Refinery and Emulsion Tank Yard

- Area 4: Crude Oil Tank Yard
- Area 5: Parking Lot and Rail Line

The nearly 60 stormwater catch basins on-site are regulated by stormwater valves with the exception of one location in Area 2, downstream of the valve at SWV-39. These valves remain in the closed position until stormwater accumulation on-site requires opening the valves. Previous video surveys, cleanouts, and a dye test of the on-site stormwater piping were conducted in 2002, 2005, and/or 2007 to evaluate conditions and verify piping locations. Potential groundwater infiltration into piping cracks was observed at select locations.

The existing-conditions drainage and conveyance for the project is organized into two separate areas, the Tank Farm Area (TFA), sometimes referred to as both pre- and post-development Area 1, and the Vacant Lot Area, sometimes referred to as pre-development Area 2. The existing conditions more accurately describe the previously developed but currently vacant conditions, including gravel roads and parking lots. The existing conditions and drainage areas are shown on Sheets 2 through 4 in Appendix A. The total project area is approximately 13.6 acres. The pre-development TFA contains approximately 5.3 acres of impervious area from tanks and pavement, and the Vacant Lot area contains approximately 7.5 acres of impervious areas due to roads and gravel and 0.8 acres of pervious area.

3.2 Wastewater System

An American Petroleum Institute (API) oil/water separator (OWS) is located at the Site and receives wastewater from the following on-site sources:

- On-site strip drains
- Floor drains inside buildings and warehouses
- Water draws on the crude and light products tanks
- Pump cooling water
- Boiler blow-down
- Truck loading and unloading areas
- Pipe trenches
- Pump containment pads

The total containment volume for the OWS is 88,649 gallons. In general, the OWS system includes an oversized dual-pass separator that receives the Site wastewater; the discharge of the oil fraction is pumped into Tank 111 (which as a storage capacity of an additional 286,000 gallons) and the water fraction is pumped into Tank 113. Manually-controlled batch discharges of the water fraction to the sanitary sewer from Tank 113 occur under Wastewater Discharge Permit #419.002. In the event of any release at the facility that resulted in an exceedance of the OWS itself, the oil products would be contained in Tank 111 and not released.

The system is maintained to assure that there are always at least 126,000 gallons of capacity in Tank 111 which can be used for secondary containment during a spill event.

Sediments collect in the bottom of the separator and are cleaned out periodically with a sludge pump. Treatment of the wastewater is not conducted. Additional details regarding the facility wastewater system were provided in a July 1, 2020 letter to the City of Portland Bureau of Development Services (Apex, 2020a).

3.3 Stormwater Monitoring Program and Sampling Results

Stormwater is monitored at the Site in accordance with the 1200-Z permit. Four monitoring events are conducted annually; the first sampling event of each half-year period includes collection of stormwater to perform analyses for both 1200-Z Benchmark Pollutants and Impairment Pollutants. The second sampling event of each half year includes analyses for Benchmark Pollutants only. Stormwater samples are collected at vaults SWV-33 and SWV-39, which are located just upstream of their respective discharge points to the two municipal storm sewers. A field measurement of pH is taken at each sampling location just prior to sample collection. During sampling of Impairment Pollutants, the stormwater to be analyzed for dissolved metals (i.e. copper and lead) is field-filtered.

Once sample results are received, the results are compared to applicable benchmarks and reference concentrations. If there are any exceedances, Zenith prepares Tier I Reports for corrective action. The results further support Zenith's filing of the annual Discharge Monitoring Report for the Site.

The results of recent sampling events are provided in Tables 2 and 3, and the most recent Discharge Monitoring Reports are provided in Appendix C. Benchmark exceedances of total copper, total zinc, total suspended solids (TSS), dissolved copper, and dissolved iron have been observed in 2019 and 2020 at SWV-33. Benchmark exceedances of TSS, total iron, and benzo(g,h,i)perylene have been observed in 2019 and 2020 at SWV-39. The sample concentrations were also compared to the drinking water maximum contaminant levels (MCLs) and the occupational groundwater ingestion and inhalation from tapwater RBCs; total lead was detected above both the MCL and the RBC in SWV-33 and SWV-39 in 2019 and 2020.

Corrective actions are being implemented at SWV-33 to meet Tier II Corrective Action requirements by June 2021. In January 2020, EnviroSoxx® with MetalLoxx® biofiltration system socks were installed to address Tier II exceedances. Metal roof surfaces will be painted and additional catch basin inserts will be installed in 2020. The effectiveness of these BMPs will be evaluated during the 2020 sampling events.

4.0 Proposed System

This Section presents the design approach and assumptions, conveyance design, and impervious area treated. The project is completely contained within railroad tracks and tank farms; therefore, landscaped

infiltration is inconsistent with fire safety requirements. The project has been designed to completely contain a 100-year, 24-hour rain event with significant buffer.

4.1 Design Approach

Apex used the following design assumptions for post-development.

1. The project will contain a 100-year, 24-hour storm with a safety factor of at least 10 for each developed drainage basin so no run-off is anticipated, and no connection to a private or public storm sewer system is necessary.
2. Pipe conveyance systems were designed to have a safety factor of 2 for the 100-year, 24-hour storm peak flow for the entire drainage basin to allow for some pipe blockage (such as from sedimentation).
3. All soil slopes are designed to a maximum grade of four horizontal to one vertical (4H:1V) to ensure stable slopes.
4. Since the site is being constructed on dredge-fill soils, all load bearing soils should follow the recommendations in the Geotech report dated March 18, 2020.
5. Compaction testing should be completed during construction to ensure the minimum compaction requirements are achieved.
6. The Soil Conservation Service Technical Release 55 (SCS TR-55) Method was used to calculate Time of Concentration (Tc) and Peak Flow Calculations Q for both pre and post development drainage areas. The calculations were completed on spreadsheets with the backup documentation provided for each calculation page.
7. Pre-development TFA used an aggregate Curve Number (CN) of 98.
8. Pre-development Vacant Lot Area used an aggregate CN of 75.3.
9. The Post-Development TFA used an aggregate CN of 98.
10. The Post-Development South Stormwater Infiltration Basin (SSIB) and North Stormwater Infiltration Basin (NSIB) are both based on an aggregate CN of 76. The CN did not change significantly because a majority of the areas are covered in loose rock (ballast) and gravel that is similar to the existing conditions. These curve numbers account for the impervious unloading rack canopy.
11. The basin hydrographs were based on the SCS TR-55 method and completed in spreadsheets to idenitify the storage volume required based on the infiltration rate. The inflow was based on the TR-55 Q value (depth in inches) and the infiltration rate for the basins and swale was based on one half the average infiltration rate for Post Development SSIB and NSIB at 3.3 inches per hour.

The post-development areas are defined as the TFA, which is consistent with the existing conditions with the exception that a one-acre portion is added to the SSIB area for railroad access. The post-development TFA

continues with approximately 3.7 acres of impervious area. The Vacant Lot area is split into two drainage basins: the SSIB, sometimes referred to as pre-development Area 2; and the NSIB, sometimes referred to as post-development Area 3. The SSIB area contains approximately 3.7 acres of impervious area and no pervious area. The NSIB contains approximately 6.2 acres of impervious area. The post-development layout and drainage areas are shown on Sheets 5 through 7 in Appendix A.

The TFA run-off does not significantly change between the pre- and post-development and stormwater will be completely contained to eliminate any run-off per Spill Pollution Control and Countermeasures (SPCC) requirements. This area drains to a drop inlet that remains normally closed by a manual valve. This valve is opened only to drain stormwater if needed and the stormwater is inspected to make sure it does not have a sheen prior to discharge. Because this area is sized to capture both stormwater and the largest tank release, this area was not included in the post-development infiltration and stormwater conveyance design. It is Apex's understanding that this area is rarely, if ever, drained to the stormwater system and rainwater routinely infiltrates the tank area.

Apex calculated the run-off using the SCS TR-55 methodology with the City of Portland specified storm events and designed the infiltration to handle a 100-year, 24-hour storm with buffer. The unloading areas were designed to capture and infiltrate all rain and run-off for a 100-year 24-hour rain event. The area is set up with the following key drainage features.

- One approximately 800-foot long level infiltration swale.
- Two infiltration basins.
- Three piping systems that drain water from track and roof areas to the infiltration basins.
- One piping system that connects the NSIB to the swale to allow flow between the infiltration features if one of the features is overwhelmed.

The developed site has very little impervious area. The only impervious areas are the unloading rack canopy at 24,030 square feet, the railroad ties, and the rails. The area covered by the railroad ties and rails will serve as pervious area as the water that enters this limited area will flow into the adjacent ballast rock which helps infiltrate the water with little run-off. The rest of the project will most of the time be considered pervious, but for this assessment has been conservatively assumed to be impervious with a CN of 76. The entire developed project will have very little run-off and will treat all run-off through infiltration in basins with large factors of safety. No new sources of contamination for stormwater are anticipated as a result of the Renewable Fuel Project.

4.2 Wastewater

The new concrete containment structure for the Renewable Fuel Project is designed to contain the volume of one full railcar with additional capacity for firefighting water per NFPA design requirements. As the rail transfer area is covered, stormwater will not be collected within the containment. Any spills or water in contact with

the containment will be pumped to the existing OWS, processed through the existing wastewater system, and ultimately sent to the sanitary sewer under Zenith's wastewater discharge permit.

The OWS was original designed and installed to properly handle a catastrophic failure when the Site was historically operated as a refinery. Based on a capacity analysis, with a pumped flow rate of 500 gallons per minute (gpm), the OWS is capable of treating 262,800,000 gallons per year. Under current use conditions, which consists only of bulk petroleum storage and product loading and unloading, the Site is consistently using less than 10 percent of the potential flow capacity of the OWS, with total discharged wastewater volumes ranging between 4,431,709 and 18,478,613 gallons over the period of 2014 through 2019. Therefore, there is sufficient volume to contain any spill that may occur in the proposed project area. Additional protection is provided by the storage capacity of the batch tank, which would not be released to the sewer if oil products exceeded the capacity of the OWS.

5.0 Summary of Findings

Historically, the project area has been vacant and has not been used to generate, store, or treat hazardous substances or petroleum products. Based on review of the ERIS report (Appendix B) and historical reports for the Site and vicinity, sufficient information was deemed available to determine if the proposed project presents a groundwater concern. Based on review of the available information, no additional chemical analyses for soil or groundwater are required, and the proposed facility can be operated without adversely impacting groundwater quality within a 1,000-foot radius of the Site.

Groundwater in the immediate vicinity of the proposed infiltration facility does not contain constituents above applicable RBCs. Only one constituent (anthracene) was detected in the groundwater samples collected in July 2020 from monitoring wells U-North and U-South , and the anthracene concentration was less than the applicable RBCs.

Constituents in recently-collected stormwater data were compared to drinking water MCLs and the Groundwater Ingestion and Inhalation from Tapwater Occupational DEQ RBC. As shown in Table 2 and Table 3, no petroleum constituent concentrations were detected above the MCLs or RBCs. In December 2019, concentrations of total lead were detected above the MCL and RBC; however, the corresponding dissolved lead concentrations were less than the applicable MCL and RBC. Recent stormwater sampling and submitted DMRs are expected to be representative of future stormwater concentrations that will enter the proposed infiltration basin.

The new concrete containment structure for the Renewable Fuel Project is designed to contain the volume of one full railcar with additional capacity for firefighting water per NFPA design requirements. As the rail transfer area is covered, stormwater will not be collected within the containment. Any spills or water in contact with the containment will be pumped to the existing OWS, processed through the existing wastewater system, and

ultimately sent to the sanitary sewer under Zenith's wastewater discharge permit (as described in Section 3.2 above). Wastewater system discharge samples collected between 2014 and 2020 have generally been non-detect for oil and grease. Only two samples have had detections of oil and grease, in 2014 and 2015, and the highest concentration was 6.1 ppm, well below the City of Portland limit of 100 ppm. Samples from the major components of the OWS system were also collected in June 2020. A low concentration of oil and grease (5.56 ppm) was detected just above the laboratory reporting limit in the sample collected from the down-stream effluent from the OWS, well below the City of Portland limit of 100 ppm.

As documented in Section 2.6, numerous cleanup sites were identified in the vicinity of the proposed project area. However, most of these cleanup sites: have an NFA status from DEQ or EPA; have impacts that are reported to be contained on their properties; and/or are downgradient of the Site. The upgradient sites that have reported contamination that could affect the Site (Unocal Willbridge Terminal / Phillips 66 Terminal / Willbridge Terminal / Tosco) are located more than 500 feet west-northwest of the proposed project area and are not expected to impact the undeveloped area of the Site.

Based on review of historical soil and groundwater sampling events near the proposed project area, there are no documented releases within the proposed project area. Soil concentrations are generally non-detect for petroleum constituents; therefore, soil impacts leaching to groundwater is not a concern. TPHd has been detected historically in groundwater collected from well W-29; however, this well is located outside the proposed infiltration areas.

Based on our review of available information pertaining to the Site and vicinity history, local geology and hydrogeology, and project design as described above, the proposed operations within the Renewable Fuels Project Area will not result in pollution of groundwater or impairment of its highest potential use. The project will not contribute contamination to stormwater or groundwater, and the proposed infiltration facility is designed to operate without adversely affecting Site and vicinity groundwater quality. In addition, the proposed project will not exacerbate the limited existing contamination on-site (to the west) or on adjacent and nearby sites.

o-Xylene	<0.500	<0.500	--	23,000

Notes:

1. **Bold** values represent detected concentrations.
2. Shaded values represent an exceedance of one or more RBCs.
3. µg/L = Micrograms per liter (parts per billion).
4. RBC = Oregon DEQ Risk Based Concentration for listed exposure pathway, revised May 2018.
5. > S = The groundwater RBC exceeds the solubility limit for the analyte.
6. -- = Value is not available.

Table 2. Zenith Energy Management - Portland, Oregon
Summary of Stormwater Sampling Results for 2019-2020 Rain Year

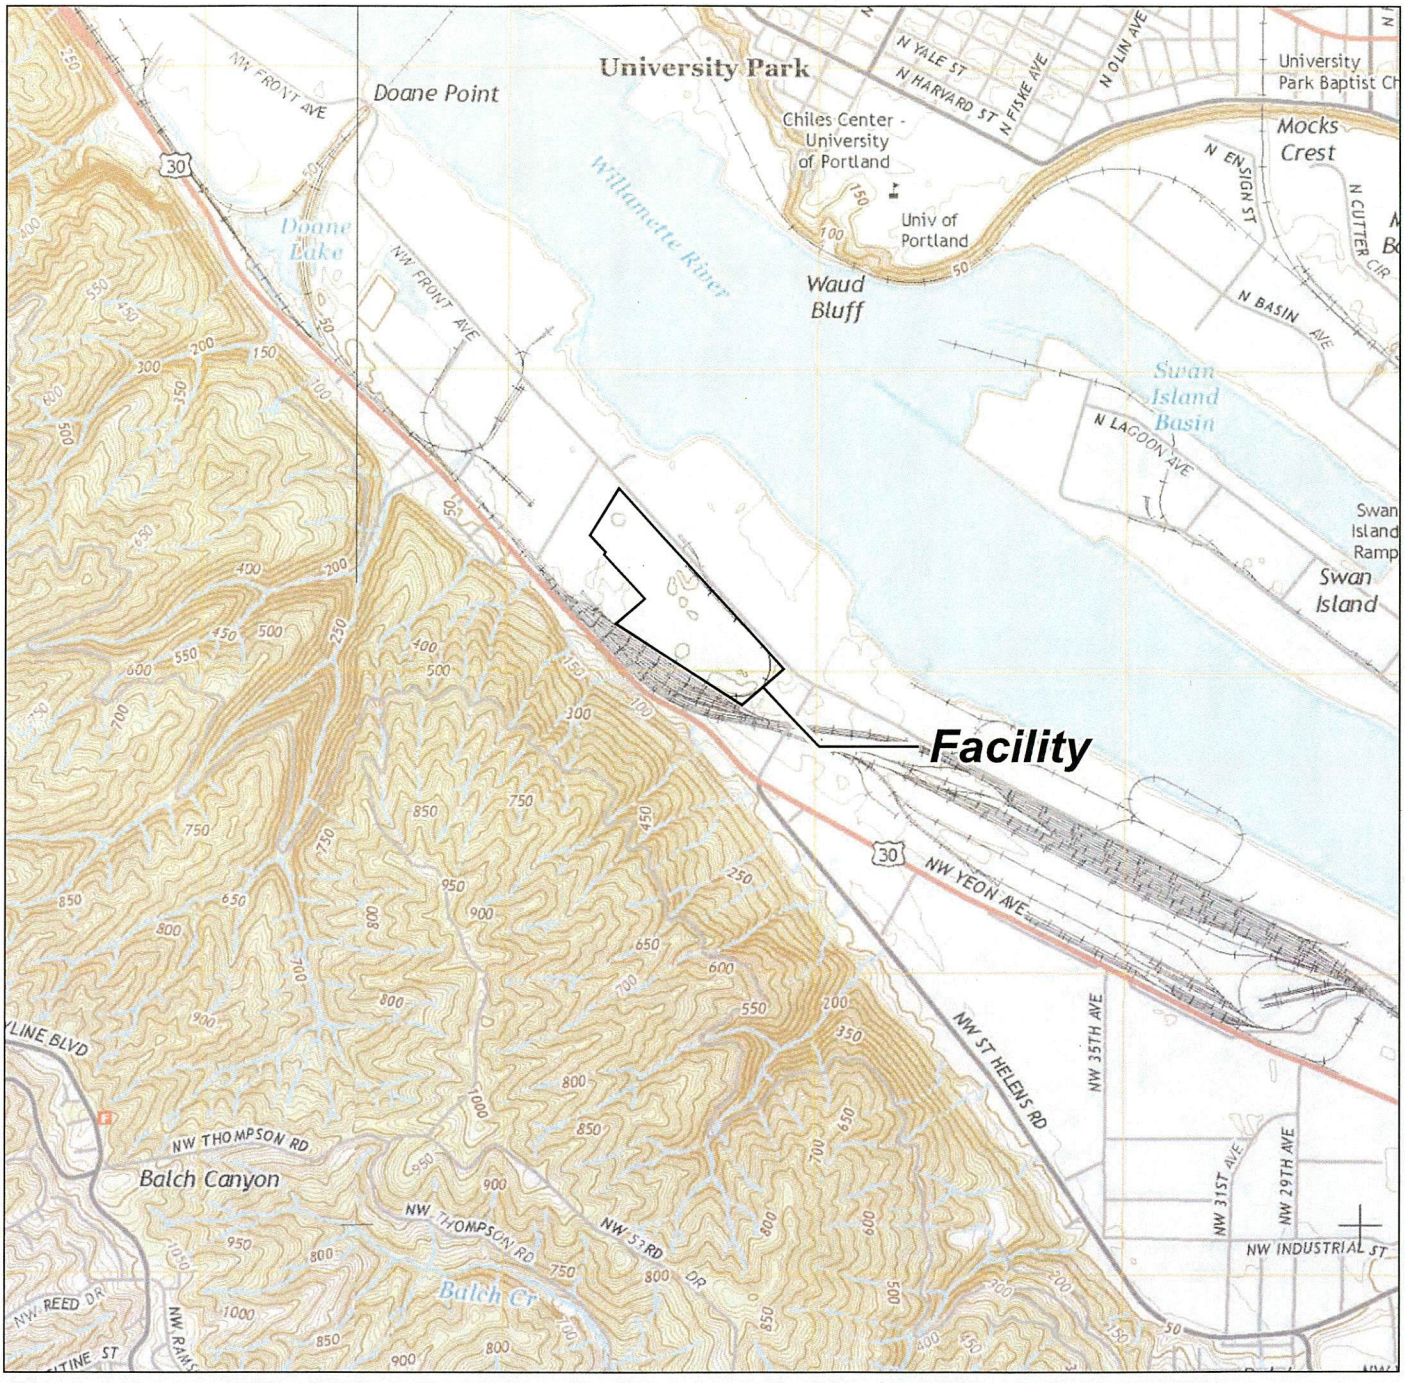
Notes:



1. mg/L = Milligrams per liter.
2. **Bold** = Analyte detected above the minimum reporting limit.
3. Bold Box = Concentration above the applicable MCL or RBC.
4. U = Analyte not detected above the minimum reporting limit.
5. UJ = Result was not detected but the reporting limit is estimated.
6. J = Result is an estimated value.
7. Reference concentrations for select impairment pollutants were updated in accordance with Oregon DEQ letter, dated December 4, 2017.
8. Screening level values from the Portland Harbor Joint Source Control Strategy (JSCS) Table 3-1, December 2005.
7. For non-detections, geometric mean calculated using one-half the detection limit.

48" to 72"	One half (½) dia. of pipe

GENERAL NOTES FOR ALL DETAILS:

1. Surfacing of paved areas shall comply with street cut Std. Dwg. RD302.
2. For pipe installation in embankment areas where the trench method will not be used and the pipe is ≥ 36" diameter, increase dimension "B" to nominal pipe diameter.
3. Pipes over 72" diameter are structures, and are not applicable to this drawing.
4. See Std. Dwg. RD336 for tracer wire details (When required).

RD339

GENERAL NOTES FOR ALL DETAILS:

1. See Std. Dwgs. RD364, RD365, and RD366 for inlet details not shown.
2. See appropriate standard drawings or special project details for other similar structures.
3. Location, elevation, diameter, slope, and number of pipe(s) varies, see project plans.
4. Max. pipe diameter varies with pipe material.
5. All connecting pipes shall have a tracer wire, or approved alternate. NO TRACER ON STEEL PIPE
   See Std. Dwg. RD336 for tracer wire details.
6. When rigid pipe is used, the connecting pipe shall have a flexible, gasketted and unrestrained joint within 18" of manhole wall. Joint type varies with manufacturer.
7. When flexible pipe is used, install resilient connectors conforming to requirements of ASTM C923.
8. Pipe zone varies, see Std. Dwg. RD300.

Discharge Monitoring Report
1200-Z Permit

For official use only:
Legal Name: Zenith Energy Terminal Holdings, LLC
DEQ File No: 16055

Instructions: This report must be completed for each quarter and submitted by the 15th of February, May, August and November to the appropriate DEQ regional or agent office. The report must contain the results of all stormwater monitoring conducted during each quarter, and variance requests are due semi-annually, in February and August. Sample for the pollutants at monitoring location(s) specified in your SWPCP and use the monitoring location(s) number from your SWPCP. You must include the laboratory results, including minimum detection level, Quality Assurance/Quality Control and analytical methods for the parameters analyzed. You must also submit pH field notes and chain of custody.

Oregon Department of Environmental Quality
Stormwater Program

DEQ
State of Oregon Department of Environmental Quality

Discharge Monitoring Report
1200-Z Permit

National Pollutant Discharge Elimination System Permit
Industrial Stormwater Discharge General Permit

Instructions: This report must be completed for each quarter and submitted by the 15th of February, May, August and November to the appropriate DEQ regional or agent office. The report must contain the results of all stormwater monitoring conducted during each quarter, and variance requests are due semi-annually, in February and August. Sample for the pollutants at monitoring location(s) specified in your SWPCP and use the monitoring location(s) number from your SWPCP. You must include the laboratory results, including minimum detection level, Quality Assurance/Quality Control and analytical methods for the parameters analyzed. You must also submit pH field notes and chain of custody.

Facility Information

Legal name: Zenith Energy Terminal Holdings, LLC
DEQ File No: 16055
Common name: Zenith Energy Terminals Portland
EPA #: ORR700124
Facility address: 5501 NW Front Avenue
Reporting Quarter: ☐ 1st ☑ 2nd ☐ 3rd ☐ 4th
Facility City, Zip: Portland, OR 97210
Reporting Year: 2019 to 2020
Geo-Region: ☐ Columbia Slough ☐ Columbia River ☑ Portland Harbor ☐ Regional
2nd Geo-Region ☐ Columbia Slough ☐ Columbia River ☐ Portland Harbor ☐ Regional
Administrated by: ☐ DEQ ☐ Clean Water Services ☑ City of Portland ☐ City of Eugene
Primary SIC Code: 4226
Secondary SIC Code: 2911

Monitoring Information

Number of discharge point(s): 2
Number of monitoring location(s): 2

If different, you certify that the facility has established either: 1) the area has no exposure of stormwater to industrial activities, or 2) the effluent is substantially similar to effluent(s) monitored and the same BMPs are implemented and maintained. (See permit pg 23)

Monitoring Waiver(s) If yes list date on DEQ or Agent approval letter.

MM/DD/YY			

DMR Submittal Checklist Please check all applicable documents are included with you DMR submittal:

☑ Original Signature ☑ Laboratory Reports ☐ Chain of Custody ☑ QA/QC form Lab ☐ pH field sheets

Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations (40 CFR 122.22(d)).

Reliance on information in Report: This report DOES NOT replace a full Phase I Environmental Site Assessment but is solely intended to be used as database review of environmental records.

License for use of information in Report: No page of this report can be used without this cover page, this notice and the project property identifier. The information in Report(s) may not be modified or re-sold.

Your Liability for misuse: Using this Service and/or its reports in a manner contrary to this Notice or your agreement will be in breach of copyright and contract and ERIS may obtain damages for such mis-use, including damages caused to third parties, and gives ERIS the right to terminate your account, rescind your license to any previous reports and to bar you from future use of the Service.

No warranty of Accuracy or Liability for ERIS: The information contained in this report has been produced by ERIS Information Inc. ("ERIS") using various sources of information, including information provided by Federal and State government departments. The report applies only to the address and up to the date specified on the cover of this report, and any alterations or deviation from this description will require a new report. This report and the data contained herein does not purport to be and does not constitute a guarantee of the accuracy of the information contained herein and does not constitute a legal opinion nor medical advice. Although ERIS has endeavored to present you with information that is accurate, ERIS disclaims, any and all liability for any errors, omissions, or inaccuracies in such information and data, whether attributable to inadvertence, negligence or otherwise, and for any consequences arising therefrom. Liability on the part of ERIS is limited to the monetary value paid for this report.

Trademark and Copyright: You may not use the ERIS trademarks or attribute any work to ERIS other than as outlined above. This Service and Report (s) are protected by copyright owned by ERIS Information Inc. Copyright in data used in the Service or Report(s) (the "Data") is owned by ERIS or its licensors. The Service, Report(s) and Data may not be copied or reproduced in whole or in any substantial part without prior written consent of ERIS.

Executive Summary

Property Information:

Project Property:		*Zenith Portland* *5501 NW Front Ave Portland OR 97210*
Project No:		*2291-29*
Coordinates:		
	Latitude:	*45.56013379*
	Longitude:	*-122.73643972*
	UTM Northing:	*5,045,211.01*
	UTM Easting:	*520,569.19*
	UTM Zone:	*10T*
Elevation:		*40 FT*

Order Information:

Order No:	*20281900323*
Date Requested:	*August 19, 2020*
Requested by:	*Apex Companies, LLC*
Report Type:	*Database Report*

Free product in groundwater in the general vicinity of the site prompted DEQ to request a PA in 1993.

8/21/07 Groundwater contamination is localized wihtin the site property. Free product consists of relatively immobile asphalt-related petroleum. Elevated concentrations of metals and PAHs have been detected in the storm system sediments, and to a lesser extent in storm water.

Incidental spills during operations, transport, and transfer since 1947.

A total of 6 spills are on record in DEQ Spill Program Files, although at least 3 other significant spills occurred at the site since 1957.

Most spills involved crude oil or asphaltic emulsions of low mobility that hardened upon cooling. On April 15, 1998 a tanker truck carrying 9000 gallons of gasoline crashed through the Chevron fence, rolled over and caught fire resulting in the death of the driver. Much of the fuel reportedly burned. Fire suppression water and residual gasoline were reportedly contained in the API separator system. CET Environmental Services responded to the scene on behalf of the trucking firm. They checked storm drain outfalls in the surrounding area and reported oil and debris were present. It is not clear at which outfall the oil was observed. CET flushed out the storm lines in the surrounding area. Ten gallons of fuel were recovered from the storm drain.
Most recently, on July 1, 2008, approximately 840 gallons of crude oil were spilled in the crude products tank yard while transferring crude oil from tank T-104 to tank T-105. DEQ was notified and participated in the spill response actions conducted by PPC. The spill did not occur near any stormwater catch basins, and no oil entered the on-site stormwater system. Some of the oil collected in wastewater catch basin WWCB-62, which drains to the on-site API oil-water separator. Assessment and cleanup activities satisfied DEQ Spill Program requirements and no additional work was required.

Jim Orr 7/15/2011 to 2019
Approximately 19,000 gallons of naphtha released from a pipe. Product and water recovered with duel phase recovery system and vac trucks and product thickness measured. Product measured in one sump (S-8) in May 2014 was 0.13-feet. Product levels have been trending lower. Monitoirng will continue.

The site is located near the southwest bank of the Willamette River at river mile 8.25, and is approximately 0.25 mile from the river. The risk to human health in the site upland appears low. However, the site has a large storm water conveyance system, and discharges to the Willamette River throught City of Portland Outfalls 19 and 22.

After review of Environmental Site Assessment, SRS transferred project to VCS in April 1994. (2/14/95 MHK/VCS) Chevron terminated its Voluntary Agreement, and plans to proceed with an independent cleanup. This site is not part of the Willbridge Bulk Fuel Area site (ECSI #1549).

(3/11/03 MTP/VCP), DEQ's site assessment section reevaluated the site and determined the site was a high priority for an expanded preliminary asssessment on January 17, 2002. Primary concerns at the site are contamination discharge to or migration along storm sewers and other utililitiy lines/corridors, and potential impacts to the Willamette river. Chevron entered into a letter agreement with DEQ on January 30, 2003. A revised work plan for an expanded Preliminary Assessment (XPA) is currently under DEQ review.

(8/21/07 MTP/VCP) Chevron has completed the XPA for soil and groundwater. Stormwater discharges appear to be the only pathway of concern at the site. Paramount Petroleum is the current operator, and is assisting in the investigation.

A program of stormwater monitoring and catch basin cleanout has been established. A complete delineation of the system still needs to be completed to resolve uncertainly in stormwater system configuration. DEQ anticipates the source-control decision will be completed by Summer 2008.

5/1/10 MTPugh

Chevron completed a Source Control Evaluation to identify site-related contaminants and assess whether the site was a current or potential source of contamination to the Willamette River from uncontrolled environmental releases. Specific tasks completed as part of the Source Control Evaluation include:

- Catch basin sediment sampling, analysis, cleanout
- Camera survey of active and inactive storm drain lines at the site
- Cleanout of accessible on-site storm drain lines
- Cleanout of off-site storm drain lines
- Four rounds of stormwater sampling
- Identification of additional best management practices for stormwater management
- Stormwater Pollution Control Plan revision to incorporate best management practices

Based on a review of the May 2009 Source Control Evaluation report and related documents, DEQ concludes that this site is not a significant ongoing source of contaminants to the Willamette River, and that source control measures implemented at the site will prevent potential future significant impacts. Paramount Petroleum Corporation has agreed to maintain best management practices as outlined in the revised Stormwater Pollution Control Plan. A discussion of site conditions, monitoring results, source control measures, and the basis for DEQ's finding, is contained in a Source Control Decision dated March 16, 2010.

Comment:

The processes and operations at the site include asphalt refining, emulsions manufacturing and asphalt blending. The refinery produces asphalt, asphalt emulsions, modified asphalt emulsions for roofing products, vacuum gas oil for gasoline refinery feedstock, kerosene, naphtha and middle distillates.

Oil storage from rail tranport to barges is a current use for the facility.

Caustic soda and hydrochloric acid are stored in aboveground tanks in the refinery and emulsions tank yard area. Historically, ferric chloride was used in manufacturing at the site. It is no longer used, but the tank and its containment remain in place for potential use in the future.

Currently, no polychlorinated biphenyl (PCB) transformers are present on site. Historically, PCB transformers were present on site; however, they were all removed prior to 1996. The specific location and details of the removal of historical PCB transformers are unknown.

Chevron registered with EPA as a hazardous waste generator in 1981 and was a large quantity generator (LQG) during their tenure at the site. Paramount Petroleum, the current operator, reported as a LQG in 2006 based on the volume of tank bottom sludge. Paramount Petroleum is now a CEG of hazardous waste, with reported waste streams in 2008 consisting of solvent on rags, aerosol cans, limited tank bottom sludge, 5 pounds waste mercury, and 15 pounds of mercury waste generated during cleanup of spill residue. Records from 2000 indicate 9 kilograms of mercury waste were generated from ongoing processes and disposed off-site. Mercury use at the site is associated with the laboratory, located near stormwater catch basin (SWCB) 37. Catch basin sampling discussed below showed a highly elevated mercury concentration in SWCB-37.

Historical hazardous waste streams include chromium waste (D007) from tank bottom sludge, and sand blast grit and paint chips containing cadmium (D006) and lead (D008). D018 (benzene) listed waste represents a major portion of hazardous waste historically generated at the site (100,000 kilograms annual) and either tank bottom and/or API separator sludge.
Residual SPH in 5 shallow monitoring wells is a potential source of dissolved phase contamination in groundwater, but impacts appear highly localized around these wells. Low to moderately impacted soil and residual asphaltic particulates from historical spills are potential contaminant sources to the stormwater system via accumulation in catch basins and potential migration into the stormwater conveyance system. This was the primary contaminant source and pathway evaluated for the SCE as described below.

Comment:

Potential for direct contact. Although a formal risk assessment has not been conducted, the soil and groundwater contamination does not appear to present a signifcant health threat.

The potential health threat to human health from storm water discharges to the Willamette River do not appear to be significant.

Because there does not appear to be a benefical use for shallow groundwater at the site, the drinking water pathway is not of concern.

Comment:

Chevron, a former owner and operator of this site, conducted a Portland Harbor Source Control Evaluation to assess potential impacts to the Willamette River. A program of stormwater monitoring and catch basin cleanout was established. After completion of this work DEQ issued a source control decision in 2010, documenting the agency decision that the site does not pose a risk of recontaminating future remedial actions in the Willamette River. The Source Control Decision document contains a discussion of site conditions, monitoring results, source control measures, and the basis for DEQ's decision. The draft document was reviewed by partner agencies including the City of Portland and US Environmental Protection Agency (US EPA) in accordance with established procedures detailed in the memorandum of understanding between US EPA and Oregon DEQ for Willamette River Source Control. DEQ finalized the decision in 2010 after considering reviewer comments.

Based on a review of the Source Control Evaluation prepared by Chevron, and as documented in DEQ's Source control Decision memo, DEQ concludes that the site media have been adequately characterized to assess the potential for site-related impacts to the Willamette River. A series of best management practices (BMPs) were implemented that DEQ determined are adequate to control contaminant sources at the site. Per the Portland Harbor Joint Source Control Strategy, DEQ determined that stormwater evaluation or source control measures were adequate to control sources. This decision is contingent upon the site operator, PPC, maintaining the BMPs identified in the stormwater pollution control plan.

Currently, DEQ is overseeing work related to a spill of Naptha that occurred in 2011. The spill required cleanup up work extracting vapor and water from soil and groundwater in the vicinity of the spill. DEQ anticipates that this work may be concluded in 2019.

Work is ongoing to evaluate soil below the footing of a former product storage tank and is under an Independent Cleanup Agreement.

In 2018 the City of Portland detected a sheen on stormwater discharges during 1200z industrial stormwater compliance monitoring. Repairs to the

Map Key	Number of Records	Direction	Distance (mi/ft)	Elev/Diff (ft)	Site	DB

system corrected the problem.

Comment:

Chevron, a former owner and operator of this site, conducted a Portland Harbor Source Control Evaluation to assess potential impacts to the Willamette River. A program of stormwater monitoring and catch basin cleanout was established. After completion of this work DEQ issued a source control decision in 2010, documenting the agency decision that the site does not pose a risk of recontaminating future remedial actions in the Willamette River. The Source Control Decision document contains a discussion of site conditions, monitoring results, source control measures, and the basis for DEQ's decision. The draft document was reviewed by partner agencies including the City of Portland and US Environmental Protection Agency (US EPA) in accordance with established procedures detailed in the memorandum of understanding between US EPA and Oregon DEQ for Willamette River Source Control. DEQ finalized the decision in 2010 after considering reviewer comments.

Based on a review of the Source Control Evaluation prepared by Chevron, and as documented in DEQ's Source control Decision memo, DEQ concludes that the site media have been adequately characterized to assess the potential for site-related impacts to the Willamette River. A series of best management practices (BMPs) were implemented that DEQ determined are adequate to control contaminant sources at the site. Per the Portland Harbor Joint Source Control Strategy, DEQ determined that stormwater evaluation or source control measures were adequate to control sources. This decision is contingent upon the site operator, PPC, maintaining the BMPs identified in the stormwater pollution control plan.

Currently, DEQ is overseeing work related to a spill of Naptha that occurred in 2011. The spill required cleanup up work extracting vapor and water from soil and groundwater in the vicinity of the spill. DEQ anticipates that this work may be concluded in 2019.

Work is ongoing to evaluate soil below the footing of a former product storage tank and is under an Independent Cleanup Agreement.

In 2018 the City of Portland detected a sheen on stormwater discharges during 1200z industrial stormwater compliance monitoring. Repairs to the system corrected the problem.

Free product in groundwater in the general vicinity of the site prompted DEQ to request a PA in 1993.

8/21/07 Groundwater contamination is localized wihtin the site property. Free product consists of relatively immobile asphalt-related petroleum. Elevated concentrations of metals and PAHs have been detected in the storm system sediments, and to a lesser extent in storm water.

Incidental spills during operations, transport, and transfer since 1947.

A total of 6 spills are on record in DEQ Spill Program Files, although at least 3 other significant spills occurred at the site since 1957.
Most spills involved crude oil or asphaltic emulsions of low mobility that hardened upon cooling. On April 15, 1998 a tanker truck carrying 9000 gallons of gasoline crashed through the Chevron fence, rolled over and caught fire resulting in the death of the driver. Much of the fuel reportedly burned. Fire suppression water and residual gasoline were reportedly contained in the API separator system. CET Environmental Services responded to the scene on behalf of the trucking firm. They checked storm drain outfalls in the surrounding area and reported oil and debris were present. It is not clear at which outfall the oil was observed. CET flushed out the storm lines in the surrounding area. Ten gallons of fuel were recovered from the storm drain.
Most recently, on July 1, 2008, approximately 840 gallons of crude oil were spilled in the crude products tank yard while transferring crude oil from tank T-104 to tank T-105. DEQ was notified and participated in the spill response actions conducted by PPC. The spill did not occur near any stormwater

catch basins, and no oil entered the on-site stormwater system. Some of the oil collected in wastewater catch basin WWCB-62, which drains to the on-site API oil-water separator. Assessment and cleanup activities satisfied DEQ Spill Program requirements and no additional work was required.

Jim Orr 7/15/2011 to 2019
Approximately 19,000 gallons of naphtha released from a pipe. Product and water recovered with duel phase recovery system and vac trucks and product thickness measured. Product measured in one sump (S-8) in May 2014 was 0.13-feet. Product levels have been trending lower. Monitoirng will continue.

The site is located near the southwest bank of the Willamette River at river mile 8.25, and is approximately 0.25 mile from the river. The risk to human health in the site upland appears low. However, the site has a large storm water conveyance system, and discharges to the Willamette River throught City of Portland Outfalls 19 and 22.

After review of Environmental Site Assessment, SRS transferred project to VCS in April 1994. (2/14/95 MHK/VCS) Chevron terminated its Voluntary Agreement, and plans to proceed with an independent cleanup. This site is not part of the Willbridge Bulk Fuel Area site (ECSI #1549).

(3/11/03 MTP/VCP), DEQ's site assessment section reevaluated the site and determined the site was a high priority for an expanded preliminary asssessment on January 17, 2002. Primary concerns at the site are contamination discharge to or migration along storm sewers and other utililitiy lines/corridors, and potential impacts to the Willamette river. Chevron entered into a letter agreement with DEQ on January 30, 2003. A revised work plan for an expanded Preliminary Assessment (XPA) is currently under DEQ review.

(8/21/07 MTP/VCP) Chevron has completed the XPA for soil and groundwater. Stormwater discharges appear to be the only pathway of concern at the site. Paramount Petroleum is the current operator, and is assisting in the investigation.

A program of stormwater monitoring and catch basin cleanout has been established. A complete delineation of the system still needs to be completed to resolve uncertainly in stormwater system configuration. DEQ anticipates the source-control decision will be completed by Summer 2008.

5/1/10 MTPugh

Chevron completed a Source Control Evaluation to identify site-related contaminants and assess whether the site was a current or potential source of contamination to the Willamette River from uncontrolled environmental releases. Specific tasks completed as part of the Source Control Evaluation include:

- Catch basin sediment sampling, analysis, cleanout
- Camera survey of active and inactive storm drain lines at the site
- Cleanout of accessible on-site storm drain lines
- Cleanout of off-site storm drain lines
- Four rounds of stormwater sampling
- Identification of additional best management practices for stormwater management
- Stormwater Pollution Control Plan revision to incorporate best management practices

Based on a review of the May 2009 Source Control Evaluation report and related documents, DEQ concludes that this site is not a significant ongoing source of contaminants to the Willamette River, and that source control measures implemented at the site will prevent potential future significant impacts. Paramount Petroleum Corporation has agreed to maintain best management practices as outlined in the revised Stormwater Pollution Control Plan. A discussion of site conditions, monitoring results, source control measures, and the basis for DEQ's finding, is contained in a Source Control Decision dated March 16, 2010.

The processes and operations at the site include asphalt refining, emulsions manufacturing and asphalt blending. The refinery produces asphalt, asphalt emulsions, modified asphalt emulsions for roofing products, vacuum gas oil for gasoline refinery feedstock, kerosene, naphtha and middle distillates.

Oil storage from rail tranport to barges is a current use for the facility.

Caustic soda and hydrochloric acid are stored in aboveground tanks in the refinery and emulsions tank yard area. Historically, ferric chloride was used in manufacturing at the site. It is no longer used, but the tank and its containment remain in place for potential use in the future.

Currently, no polychlorinated biphenyl (PCB) transformers are present on site. Historically, PCB transformers were present on site; however, they were all removed prior to 1996. The specific location and details of the removal of historical PCB transformers are unknown.

Chevron registered with EPA as a hazardous waste generator in 1981 and was a large quantity generator (LQG) during their tenure at the site. Paramount Petroleum, the current operator, reported as a LQG in 2006 based on the volume of tank bottom sludge. Paramount Petroleum is now a CEG of hazardous waste, with reported waste streams in 2008 consisting of solvent on rags, aerosol cans, limited tank bottom sludge, 5 pounds waste mercury, and 15 pounds of mercury waste generated during cleanup of spill residue. Records from 2000 indicate 9 kilograms of mercury waste were generated from ongoing processes and disposed off-site. Mercury use at the site is associated with the laboratory, located near stormwater catch basin (SWCB) 37. Catch basin sampling discussed below showed a highly elevated mercury concentration in SWCB-37.

Historical hazardous waste streams include chromium waste (D007) from tank bottom sludge, and sand blast grit and paint chips containing cadmium (D006) and lead (D008). D018 (benzene) listed waste represents a major portion of hazardous waste historically generated at the site (100,000 kilograms annual) and either tank bottom and/or API separator sludge.
Residual SPH in 5 shallow monitoring wells is a potential source of dissolved phase contamination in groundwater, but impacts appear highly localized around these wells. Low to moderately impacted soil and residual asphaltic particulates from historical spills are potential contaminant sources to the stormwater system via accumulation in catch basins and potential migration into the stormwater conveyance system. This was the primary contaminant source and pathway evaluated for the SCE as described below.

Potential for direct contact. Although a formal risk assessment has not been conducted, the soil and groundwater contamination does not appear to present a signifcant health threat.

The potential health threat to human health from storm water discharges to the Willamette River do not appear to be significant.

Because there does not appear to be a benefical use for shallow groundwater at the site, the drinking water pathway is not of concern.

Waste Code Details

Hazardous Waste Code: D001
Waste Code Description: IGNITABLE WASTE

Hazardous Waste Code: D002
Waste Code Description: CORROSIVE WASTE

Hazardous Waste Code: D004
Waste Code Description: ARSENIC

Hazardous Waste Code: D006
Waste Code Description: CADMIUM

Hazardous Waste Code: D007
Waste Code Description: CHROMIUM

Hazardous Waste Code: D008
Waste Code Description: LEAD

Hazardous Waste Code: D009
Waste Code Description: MERCURY

Hazardous Waste Code: D018
Waste Code Description: BENZENE

Hazardous Waste Code: F038
Waste Code Description: PETROLEUM REFINERY SECONDARY (EMULSIFIED) OIL/WATER/SOLIDS SEPARATION SLUDGE - ANY SLUDGE AND/OR FLOAT GENERATED FROM THE PHYSICAL AND/OR CHEMICAL SEPARATION OF

OIL/WATER/SOLIDS IN PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH WASTES INCLUDE, BUT ARE NOT LIMITED TO, ALL SLUDGES AND FLOATS GENERATED IN INDUCED AIR FLOTATION (IAF) UNITS, TANKS AND IMPOUNDMENTS, AND ALL SLUDGES GENERATED IN DAF UNITS. SLUDGES GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS), AND F037, K048, AND K051 WASTES ARE EXEMPTED FROM THIS LISTING.

Hazardous Waste Code: K051
Waste Code Description: API SEPARATOR SLUDGE FROM THE PETROLEUM REFINING INDUSTRY.

Hazardous Waste Code: U019
Waste Code Description: BENZENE (I,T)

Hazardous Waste Code: U022
Waste Code Description: BENZO[A]PYRENE

Hazardous Waste Code: U239
Waste Code Description: BENZENE, DIMETHYL- (I,T) (OR) XYLENE (I)

Incident No: 2018-1010
Incident Status: Referred/Closed
Incident Date: Tue May 8 2018
Situation:

Latitude: 45.564812
Longitude: -122.734260
County Name: Multnomah

Portland Fire HAZMAT requested an OERS number for the investigation of the release of vapors. This is at a facility that loads and offloads gasoline to barges. An alarm is triggering on one of their air monitors, signaling the possible release of vapors. Portland Fire HAZMAT believes this could be gasoline vapors as that is what crews on scene are smelling. They are enroute to the location now. No known spills at this time. Portland Fire HAZMAT is requesting a call from DEQ.

Spill Details

Media Affected: Air
Material: Other
Quantity Released: Unk

Situation:

Barge transferring oil spilled 1 gallon to the water near Portland refinery Willow bridge terminals, booms applied. Contact at scene Ross McDonald, QI person, phone number given was 541-291-2160 however when you call that number you get a message to call 541-582-0175, and do not leave a message at this number. When calling the 0175 number it goes into a busy signal that does not ring. Tried calling Simmons back and got a answering machine saying the customer is unavailable. Barge name is Elsie Bay. Address for Saus Bros is 3710 NW Front Avenue Portland, OR 97210. No other phone numbers on web site. Call received at 2243 hrs from Randy Clark, Merchants Exchange, representing clean up at location. River MP is 8.5 where this occurred phone for Randy is 503-735-5993. Randy wants to contact DEQ regarding this.

Description of Events: ON THURSDAY, NOVEMBER 30, 2000 AN INCIDENT OCCURRED WHICH RESULTED IN THE RELEASE OF APPROXIMATELY 10 GALLONS OF PRODUCT. THE RELEASE WAS APPARENTLY THE RESULT OF A PUNCTURED FIFTY-FIVE GALLON DRUM. CLEAN UP WAS PERFORMED BY FOSS ENVIRONMENTAL SERVICES, INC OF PORTLAND, OREGON. FOSS ENVIRONMENTAL SERVICES, INC. PLACED THE DAMAGED FIFTY-FIVE GALLON DRUM INTO A NINETY-FIVE GALLON OVER PACK DRUM. FOSS ENVIRONMENTAL, INC. USED ABSORBENT MATERIAL TO CONTAIN AND ABSORB THE FREE PRODUCT. THE USED ABSORBENT MATERIAL WAS PLACED INTO A FIFTY-FIVE GALLON DRUM FOR DISPOSAL. THE NINETY-FIVE GALLON OVER PACK DRUM WAS RETURNED TO THE SHIPPER FOR DISPOSITION. ONE FIFTY-FIVE GALLON DRUM OF USED ABSORBENT MATERIAL WAS TRANSPORTED TO BURLINGTON ENVIRONMENTAL INC IN SEATTLE, WASHINGTON FOR DISPOSAL.

Description of Events: WE WERE UNLOADING A SULFURIC ACID RAILCAR INTO OUR STORAGE TANK WHEN THE RAILCAR EMPTIED OUT, OUR STORAGE TANK WAS TO FULL TO HANDLE THE AIR PRESSURE FROM THE RAILCAR. IT BLEW EMPTY CAUSING THE SULFURIC TO COME OUT OF THE VENT ON THE TOP OF THE TANK. WE LATER FOUND THAT OUR GUAGE WAS SLIGHTLY OFF. OUR PERSONNEL SHUT OFF THE AIR AND PRODUCT VALVE STOPPING THE FLOW. THEY THEN SWITCHED TO ANOTHER TANK SO THE AIR PRESSURE IN THE RAIL CAR COULD FINISH BLOWING OFF. WE WILL REPLACE THE GAUGE AND IN THE FUTURE WHEN THE GAUGE READS ZERO WE WILL PUMP THE TANK TO ANOTHER JUST TO DOUBLE CHECK THAT THE TANK REALLY IS EMPTY.

Incident No: 2015-0407
Incident Status: Closed
Incident Date: 2/19/2015 4:54:00 PM
Situation:
Latitude: -124.031921
Longitude: 44.374101
County Name: Multnomah

Caller reported a rainbow sheen on Willamette River from an outfall, approximately 500 sq ft. There was a discharge from a remediation project of unknown substance. It has been contained within a boom that was already on the water.

INCIDENT NARRATIVE:

UPON ARRIVAL, E-16/HM-16 FOUND A SUNSET OIL DIESEL TRUCK LEAKING DIESEL FUEL FROM THE STORAGE TANK AT ABOUT 10-15 GAL/MIN. THE TRUCK OPERATOR, UPON FINDING THE LEAK, HAD IMMEDIATELY NOTIFIED THE FIRE BUREAU AND WAS ATTEMPTING TO DIKE THE PRODUCT AT THE STORM DRAIN. WE COMPLETED THE DIKING OPERATION AND ACTIVATED OARS. DEQ AND THE COAST GUARD ARRIVED AND EVALUATED THE POSSIBLE CONTAMINATION WHERE THE PRODUCT LEFT THE STORM DRAIN INTO THE WILLAMETTE RIVER. THERE WAS NO CONTAMINATION. THE DEQ ORDERED SUNSET OIL TO FLUSH THE STORM DRAIN OF ANY RESIDUAL DIESEL FUEL. WE ASSISTED SUNSET OIL WITH THE REMOVAL OF EXCESS AMOUNTS OF DIESEL FUEL AND TURNED THE FINAL STAGES OF CLEAN-UP OVER TO SUNSET OIL.

INCIDENT NARRATIVE:

E6 DISPATCHED NEARLY 1 - 1/2 HRS AFTER INCIDENT OCCURRED, ACCORDING TO PLANT PERSONNEL. REPORTEDLY PLANT EMPLOYEE BILL WAMPLER WAS PUMPING SODIUM HYPOCHLORITE (BLEACH) THROUGH A HOSE THAT HAD RESIDUE OF PREVIOUS PRODUCT IN IT. WORKING IN AREA WHERE RUNOFF/DRAINS GO TO PLANT TREATMENT AREA. REACTION OCCURRED, GENERATING CHLORINE GAS. PRODUCT WAS VENTED TO OUTSIDE AIR. E6 OBSERVED NO RESIDUE OR ODOR OF CHLORINE. PLANT PERSONNEL SAID DEQ AND CITY B.E.S. HAD BEEN NOTIFIED. EMPLOYEE HAD BEEN TRANSPORTED BY PRIVATE VEHICLE TO PROVIDENCE HEALTH SYSTEMS CLINIC AT 1750 NW NAITO PKWY, PORTLAND, OR 97209, SEEN BY BEN TAYLOR, M.D., AND RELEASED.

Waste Code Details

Hazardous Waste Code: D001
Waste Code Description: IGNITABLE WASTE

Hazardous Waste Code: D002
Waste Code Description: CORROSIVE WASTE

Hazardous Waste Code: D035
Waste Code Description: METHYL ETHYL KETONE

Hazardous Waste Code: D041
Waste Code Description: 2,4,5-TRICHLOROPHENOL

Hazardous Waste Code: F003
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Code: F005
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Code: F027
Waste Code Description: DISCARDED UNUSED FORMULATIONS CONTAINING TRI-, TETRA-, OR PENTACHLOROPHENOL OR DISCARDED UNUSED FORMULATIONS CONTAINING COMPOUNDS DERIVED FROM THESE

CHLOROPHENOLS. (THIS LISTING DOES NOT INCLUDE FORMULATIONS CONTAINING HEXACHLOROPHENE SYNTHESIZED FROM PREPURIFIED 2,4,5-TRICHLOROPHENOL AS THE SOLE COMPONENT.)

Hazardous Waste Code: LABP
Waste Code Description: LAB PACK

Hazardous Waste Code: U080
Waste Code Description: METHANE, DICHLORO- (OR) METHYLENE CHLORIDE

Description of Events: WHEN UNLOADING THE TRAILER A CASE WAS FOUND THAT WAS DISCOLORED AS IF IT WERE SPLASHED WITH BLEACH. FURTHER DISCOVERY FOUND THAT THE FIBERBORD BOX WAS DRY INDICATING THE LEAKAGE HAD HAPPENED BEFORE BEING LOADED AS THERE WAS NO CONTAMINATION FOF ANYTHING ELSE, IE PALLET, FLOOR OF TRAILER ETC. INVESTIGATION FOUND A CAP ON ONE OF THE BOTTLES IN THE CASE WAS LOOSE AND THIS MAY HAVE BEEN THE CAUSE OF THE DISCOLORMENT.

Source Type: Notification

Waste Code Details

Hazardous Waste Code: D002
Waste Code Description: CORROSIVE WASTE

Hazardous Waste Code: D006
Waste Code Description: CADMIUM

Hazardous Waste Code: D007
Waste Code Description: CHROMIUM

Hazardous Waste Code: D008
Waste Code Description: LEAD

Hazardous Waste Code: F002
Waste Code Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Code: F003
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Hazardous Waste Code: F005
Waste Code Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Comment:			

(5/7/92 Enforcement Section) As a result of complaints received, DEQ staff inspected the site on 11/20/91 and 12/10/91. Staff observed approximately 43 55-gallon containers of waste stored on-site. Most of the containers were of poor integrity and some were stored on soil in a non-upright position. Three above-ground waste storage tanks were observed and waste batteries (some broken) were also present. RP was unable to identify the contents in the majority of the containers. (6/17/99 JMW/SAS) Sampling results from the Portland Harbor Sediment Study revealed antimony, barium, cadmium, lead, zinc, mercury, silver, thallium, 4-methylphenol and benzoic acid in river sediments. (2/14/00 MTP/SAP) Glacier Northwest (new operator at the Lonestar parcel, ECSI #2378) submitted a Site Assessment (SA) questionnaire, a Phase I report and a soil removal report. The removal was done for TPH-impacted soil and it appears they removed most of it over 500 ppm. Limited sampling for a variety of constituents was conducted. PCBs were detected at 9 ppm in a 0-40 feet composite sample, but not in surface soil or drain sediment sample. There are indications of environmental impacts as a result of imported slag fill, including levels of Cr, Ni, Pb, and Cu in soil above SOCLEAN, and elevated pH (to 12.5) in groundwater. Of these, only Cr was above SOCLEAN. Elevated metals (over Portland Harbor reference concentrations) also appear in a storm drain sediment sample that may be a dry well. It appears these elevated metals arose from imported slag related to the Oregon Steel site, as discussed in the reports.

(5/7/92 Enforcement Section) "An assessment of the site to determine the full extent of soil and groundwater contamination...is necessary to protect the public health and the environment." See Stipulation and Final Order in file for more information. (6/17/99 JMW/SAS) Based on initial sampling results from a river sediment quality study, the Front Avenue Ltd property has been identified as a potential source of contamination to the Portland Harbor. A Site Assessment Review Notice was sent on March 4, 1999. Response from Tube Forgings has not been received. A site screening is scheduled (level III priority). (12/27/99 MTP/SAS) Strategy Recommendation completed December 10, 1999. Site consists of four tax lots occupied by three separate business owners: Tube Forgings, CMI Northwest/Hampton Lumber and Lone Star Northwest. An Expanded Preliminary Assessment (XPA) should be conducted at the site to evaluate potential upland source areas and sediment contamination resulting from discharges from the outfalls or shallow groundwater to the Willamette River. (11/1/02 ACV/VCP) Front LP Properties submitted Preliminary Assessment (PA) information. Adjacent property (McCall Oil) also undergoing a Remedial Investigation (RI). DEQ comments due in November 2002, and will include recommendations for soil and groundwater investigation.

Contamination originating at the site may represent a significant threat to human health and the environment both in the uplands portion of the site and the Willamette River.

Approximately 11 spills ranging up to 10,000 gallons have been documented on the site since it became an active petroleum-handling facility in 1946.

(3/31/95 KAC/SRS) Numerous small oil spills have occurred during the life of the facility. All were cleaned up by facility employees. A removal action was performed in 1991 when copper and arsenic contamination was discovered in the chemical plant area. An expanded PA was begun in 1994 and included the drilling of 3 wells and soil and groundwater sampling. Two additional wells were drilled in December 1994, after VOC contamination was found near the center of the property. (11/19/99 TBG/SAP) Based on initial sampling results from a river sediment quality study, the McCall Oil site has been identified as a potential source of contamination to the Portland Harbor. A Strategy Recommendation was completed in November 1999. A Remedial Investigation (RI) is required to evaluate the potential ecological threat of the sediment contamination. (3/1/00 JMW/SAP) Voluntary Agreement for Remedial Investigation and Source Control Measures forwarded to McCall Oil and Chemical Corporation on February 29, 2000. Signed agreement due back March 31, 2000. (9/20/00 TBG/VCP) RI Agreement signed 8/16/00. RI workplan submitted on September 14, 2000. (3/25/01 TBG/VCP)First phase of RI field work conducted January - March 2001. (11/20/01 TBG/VCP) Additional phases of RI field work conducted throughout 2001, and completion is expected in January 2002. The RI to date has delineated a subsurface solvent plume and petroleum contamination on-site and a contaminated stormwater discharge. The ongoing RI activities will evaluate potential off-site migration and provide further contaminant delineation. (9/28/02 TBG/VCP) Several additional phases of RI field work continue through 2002.

Comment:			

An oil spill occurred on 11/4/88 at the McCall facility. 8,400 gallons of bunker 'C' oil (asphalt, tar). Cleanup was initiated by McCall Oil. Copper and arsenic contamination was discovered near the chemical plant in 1991 and a soil removal was done. Due to contamination seen on adjoining properties, a state PA was requested in 1993. Three wells were installed in 1994 and a round of groundwater samples taken. These samples showed VOC contamination near the chemical plant. Two additional wells were installed in December 1994 to investigate the VOC material. (11/19/99 TBG/SAS) It appears site activities have resulted in sediment contamination adjacent to the site. Levels of dibenzofuran and PAHs near McCall's dock and cadmium, lead and zinc near Great Western Chemical Company's storm water outfall exceeded Portland Harbor baseline values. Although phthalates were also detected above baseline, they do not appear to be used at this site. Groundwater monitoring data shows on-site diesel or lube oil contamination may be migrating to the river, although it is not clear if subsurface migration is contributing to sediment contamination documented in the river. Although elevated levels of metals and chlorinated solvents have been detected in on-site groundwater in the past, these contaminants do not appear to be migrating to the river at this time.

Comment:			

[Jan. 2017] DEQ completed its source control decision for this site in 2014. The responsible party also requested a DEQ No Further Action determination, and DEQ requested additional soil sampling to address data gaps, before considering an NFA. In November 2016, DEQ proposed the site for an NFA. No public comments were received, and DEQ's NFA is pending.

[Jan. 2017] DEQ completed its source control decision for this site in 2014. The responsible party also requested a DEQ No Further Action determination, and DEQ requested additional soil sampling to address data gaps, before considering an NFA. In November 2016, DEQ proposed the site for an NFA. No public comments were received, and DEQ's NFA is pending.

Narrative Desc: Contamination **Last Updated on Dt:** 12/17/2002
Created by Init:
Comment:

An oil spill occurred on 11/4/88 at the McCall facility. 8,400 gallons of bunker 'C' oil (asphalt, tar). Cleanup was initiated by McCall Oil. Copper and arsenic contamination was discovered near the chemical plant in 1991 and a soil removal was done. Due to contamination seen on adjoining properties, a state PA was requested in 1993. Three wells were installed in 1994 and a round of groundwater samples taken. These samples showed VOC contamination near the chemical plant. Two additional wells were installed in December 1994 to investigate the VOC material. (11/19/99 TBG/SAS) It appears site activities have resulted in sediment contamination adjacent to the site. Levels of dibenzofuran and PAHs near McCall's dock and cadmium, lead and zinc near Great Western Chemical Company's storm water outfall exceeded Portland Harbor baseline values. Although phthalates were also detected above baseline, they do not appear to be used at this site. Groundwater monitoring data shows on-site diesel or lube oil contamination may be migrating to the river, although it is not clear if subsurface migration is contributing to sediment contamination documented in the river. Although elevated levels of metals and chlorinated solvents have been detected in on-site groundwater in the past, these contaminants do not appear to be migrating to the river at this time.

Narrative ID: 5729893 **Created on Dt:** 12/17/2002

Narrative Desc: Remedial Action **Last Updated on Dt:** 12/17/2002
Created by Init:
Comment:

(3/31/95 KAC/SRS) Numerous small oil spills have occurred during the life of the facility. All were cleaned up by facility employees. A removal action was performed in 1991 when copper and arsenic contamination was discovered in the chemical plant area. An expanded PA was begun in 1994 and included the drilling of 3 wells and soil and groundwater sampling. Two additional wells were drilled in December 1994, after VOC contamination was found near the center of the property. (11/19/99 TBG/SAP) Based on initial sampling results from a river sediment quality study, the McCall Oil site has been identified as a potential source of contamination to the Portland Harbor. A Strategy Recommendation was completed in November 1999. A Remedial Investigation (RI) is required to evaluate the potential ecological threat of the sediment contamination. (3/1/00 JMW/SAP) Voluntary Agreement for Remedial Investigation and Source Control Measures forwarded to McCall Oil and Chemical Corporation on February 29, 2000. Signed agreement due back March 31, 2000. (9/20/00 TBG/VCP) RI Agreement signed 8/16/00. RI workplan submitted on September 14, 2000. (3/25/01 TBG/VCP)First phase of RI field work conducted January - March 2001. (11/20/01 TBG/VCP) Additional phases of RI field work conducted throughout 2001, and completion is expected in January 2002. The RI to date has delineated a subsurface solvent plume and petroleum contamination on-site and a contaminated stormwater discharge. The ongoing RI activities will evaluate potential off-site migration and provide further contaminant delineation. (9/28/02 TBG/VCP) Several additional phases of RI field work continue through 2002.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680). It stipulates the following, in association with DEQ's Jan. 2007 remedy selection:

• Worker notification and training program for portions of the Property.
• Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
• Prohibition of use of shallow groundwater beneath the Property.
• Maintaining industrial or commercial land use zoning classifications on the Property.

Narrative

Comment:			

Soil and groundwater contamination have been documented at the site. Available groundwater data and the distance to the river (>1000 feet) indicate that it is unlikely that groundwater is migrating from the site to the river.

Comment:			

(06/08/2004 RGS/VCP) DEQ determined that the site is not likely a current source of contamination to the Willamette River and that the site is a low priority for further action. EPA agreed that "this site does not appear to be a current source of contamination to the river" in a letter dated May 18, 2004. DEQ recommends that additional sampling be performed to address data gaps and to further characterize hazardous substance releases in the lime pond, the acetylene plant area, and the TPH contaminated areas. This additional focused sampling is needed to determine the nature and extent of contamination and whether the site poses unacceptable risks to human health and/or the environment.

(03/20/2007 CWH/ICP) DEQ reviewed several reports summarizing site conditions and a Feasibility Study that described remedial alternatives for the site. Based on review of these records DEQ selected a remedy, codified in the Record of Decision, that stipulates the following -
• Maintain the existing cap of the site, which consists of warehouse buildings and asphalted parking area;
• Establish a restriction for all uses of groundwater below the site;
• Establish institutional controls via a site-specific contaminated soil and groundwater management plan to guide site activities as they relate to capped contamination areas;
• Record an Easement and Equitable Servitude with the property deed to establish site hazards, inspection and maintenance of the soil cap, and reporting to DEQ.
The Easement and Equitable Servitude (E&ES) was signed by DEQ and Schnitzer Investment Corp. in February 2007 and recorded with Multnomah County on March 13, 2007 (#2007-043680). Since an E&ES was the selected remedial action, the site will remain on the Confirmed Release List (CRL) and Inventory.

Comment:			

The site lies in an industrialized area. No residentially zoned properties occur within a quarter mile of the site. Because a substantial portion of the site is paved, the risk of exposure to potentially contaminated surface soil appears low. Current or future site workers and utility workers may be exposed to site contaminants in soil during construction or excavation activities. DEQ determined that it is unlikely the site is a current source of contamination to the Willamette River.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680, by C. Swick, Deputy Clerk). The E&ES stipulates the following:

Soils and groundwater on the site have been determined to be contaminated with petroleum hydrocarbons and metals, and may have high pH. In a January 25, 2007 memorandum, DEQ's Northwest Region Administrator selected a remedy to address presumed soil contamination present at the site in the Record of Decision for the Property. The remedial action selected requires:

• Worker notification and training program for portions of the Property.
• Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
• Prohibition of use of shallow groundwater beneath the Property.
• Maintaining industrial or commercial land use zoning classifications on the Property.

Comment:			

The site was identified as a potential source of contamination to the Willamette River based on initial sampling results from a river sediment study. The contamination may have resulted from discharges to city outfalls or shallow groundwater discharging to the river. A Strategy Recommendation completed in December 1999 recommended that an Expanded Preliminary Assessment (XPA) be conducted to evaluate the sediment contamination.

Sediment sampling results from the Portland Harbor revealed elevated levels of barium, cadmium, lead, mercury, silver, zinc, and benzoic acid in sediments adjacent to the site. Elevated levels of metals (zinc, chromium, and lead) and petroleum compounds were documented in subsurface soils in the portion of the site formerly used for storage of lime sludges (the lime pond). This area also had pH readings in the range of 12.5. Acetone, MIBK, and metals were detected in on-site groundwater.

Site soil and groundwater have been impacted with metals, total petroleum hydrocarbons and volatile organic compounds. Polychlorinated biphenyls (PCBs) were detected in several investigations. Metals (arsenic, cadmium, chromium, copper, mercury, lead, and zinc) detected at elevated concentrations in sediments near City of Portland Outfall No. 19 are similar to those detected on-site. Phthalates, polycyclic aromatic hydrocarbons, and PCBs were also detected in sediments near Outfall 19.

Between 1942 and 1985 an acetylene plant operated on-site. Waste products (slaked lime) were stored in on-site ponds. Two drain fields/septic systems were present on-site between about 1942 and 1971. A drywell is also reported to have existed on-site.

The site was redeveloped in 1996 and the former buildings and infrastructure were removed. Over 90% of the facility is now either paved or covered with buildings.

Narrative Desc:	Manner of Release	**Last Updated on Dt:**	10/22/2015
Created by Init:	RSTRUCK		
Comment:			

Releases are believed to have occurred during historical operations (e.g., spills, tanks) associated with the acetylene plant and the slaked lime ponds. Historically site stormwater discharges from the site were documented to contain metals. The site redevelopment in 1996 is believed to have eliminated the stormwater pathway.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680). It stipulates the following, in association with DEQ's Jan. 2007 remedy selection:

• Worker notification and training program for portions of the Property.

• Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
• Prohibition of use of shallow groundwater beneath the Property.
• Maintaining industrial or commercial land use zoning classifications on the Property.

Site soil and groundwater have been impacted with metals, total petroleum hydrocarbons and volatile organic compounds. Polychlorinated biphenyls (PCBs) were detected in several investigations. Metals (arsenic, cadmium, chromium, copper, mercury, lead, and zinc) detected at elevated concentrations in sediments near City of Portland Outfall No. 19 are similar to those detected on-site. Phthalates, polycyclic aromatic hydrocarbons, and PCBs were also detected in sediments near Outfall 19.

(06/08/2004 RGS/VCP) DEQ determined that the site is not likely a current source of contamination to the Willamette River and that the site is a low priority for further action. EPA agreed that "this site does not appear to be a current source of contamination to the river" in a letter dated May 18, 2004. DEQ recommends that additional sampling be performed to address data gaps and to further characterize hazardous substance releases in the lime pond, the acetylene plant area, and the TPH contaminated areas. This additional focused sampling is needed to determine the nature and extent of contamination and whether the site poses unacceptable risks to human health and/or the environment.

(03/20/2007 CWH/ICP) DEQ reviewed several reports summarizing site conditions and a Feasibility Study that described remedial alternatives for the site. Based on review of these records DEQ selected a remedy, codified in the Record of Decision, that stipulates the following -
• Maintain the existing cap of the site, which consists of warehouse buildings and asphalted parking area;

• Establish a restriction for all uses of groundwater below the site;
• Establish institutional controls via a site-specific contaminated soil and groundwater management plan to guide site activities as they relate to capped contamination areas;
• Record an Easement and Equitable Servitude with the property deed to establish site hazards, inspection and maintenance of the soil cap, and reporting to DEQ.
The Easement and Equitable Servitude (E&ES) was signed by DEQ and Schnitzer Investment Corp. in February 2007 and recorded with Multnomah County on March 13, 2007 (#2007-043680). Since an E&ES was the selected remedial action, the site will remain on the Confirmed Release List (CRL) and Inventory.

The site lies in an industrialized area. No residentially zoned properties occur within a quarter mile of the site. Because a substantial portion of the site is paved, the risk of exposure to potentially contaminated surface soil appears low. Current or future site workers and utility workers may be exposed to site contaminants in soil during construction or excavation activities. DEQ determined that it is unlikely the site is a current source of contamination to the Willamette River.

Releases are believed to have occurred during historical operations (e.g., spills, tanks) associated with the acetylene plant and the slaked lime ponds. Historically site stormwater discharges from the site were documented to contain metals. The site redevelopment in 1996 is believed to have eliminated the stormwater pathway.

Soil and groundwater contamination have been documented at the site. Available groundwater data and the distance to the river (>1000 feet) indicate that it is unlikely that groundwater is migrating from the site to the river.

Between 1942 and 1985 an acetylene plant operated on-site. Waste products (slaked lime) were stored in on-site ponds. Two drain fields/septic systems were present on-site between about 1942 and 1971. A drywell is also reported to have existed on-site.

The site was redeveloped in 1996 and the former buildings and infrastructure were removed. Over 90% of the facility is now either paved or covered with buildings.

The site was identified as a potential source of contamination to the Willamette River based on initial sampling results from a river sediment study. The contamination may have resulted from discharges to city outfalls or shallow groundwater discharging to the river. A Strategy Recommendation completed in December 1999 recommended that an Expanded Preliminary Assessment (XPA) be conducted to evaluate the sediment contamination.

Sediment sampling results from the Portland Harbor revealed elevated levels of barium, cadmium, lead, mercury, silver, zinc, and benzoic acid in sediments adjacent to the site. Elevated levels of metals (zinc, chromium, and lead) and petroleum compounds were documented in subsurface soils in the portion of the site formerly used for storage of lime sludges (the lime pond). This area also had pH readings in the range of 12.5. Acetone, MIBK, and metals were detected in on-site groundwater.

Comment:			

[March 2007] Soils and groundwater on the site are contaminated with petroleum hydrocarbons and metals, and may have high pH. In a January 25, 2007 memorandum, DEQ selected a remedy to address presumed soil contamination present at the site in the Record of Decision for the Property. The remedial action selected requires:

- Worker notification and training program for portions of the Property.
- Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
- Prohibition of use of shallow groundwater beneath the Property.
- Maintaining industrial or commercial land use zoning classifications on the Property.

DEQ issued a conditional no-further-action decision for the site in March 2007.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680, by C. Swick, Deputy Clerk). The E&ES stipulates the following:

Soils and groundwater on the site have been determined to be contaminated with petroleum hydrocarbons and metals, and may have high pH. In a January 25, 2007 memorandum, DEQ's Northwest Region Administrator selected a remedy to address presumed soil contamination present at the site in the Record of Decision for the Property. The remedial action selected requires:

- Worker notification and training program for portions of the Property.
- Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
- Prohibition of use of shallow groundwater beneath the Property.
- Maintaining industrial or commercial land use zoning classifications on the Property.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680). It stipulates the following, in association with DEQ's Jan. 2007 remedy selection:

• Worker notification and training program for portions of the Property.
• Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
• Prohibition of use of shallow groundwater beneath the Property.
• Maintaining industrial or commercial land use zoning classifications on the Property.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680, by C. Swick, Deputy Clerk). The E&ES stipulates the following:

Soils and groundwater on the site have been determined to be contaminated with petroleum hydrocarbons and metals, and may have high pH. In a January 25, 2007 memorandum, DEQ's Northwest Region Administrator selected a remedy to address presumed soil contamination present at the site in the Record of Decision for the Property. The remedial action selected requires:

• Worker notification and training program for portions of the Property.
• Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
• Prohibition of use of shallow groundwater beneath the Property.
• Maintaining industrial or commercial land use zoning classifications on the Property.

Between 1942 and 1985 an acetylene plant operated on-site. Waste products (slaked lime) were stored in on-site ponds. Two drain fields/septic systems were present on-site between about 1942 and 1971. A drywell is also reported to have existed on-site.

The site was redeveloped in 1996 and the former buildings and infrastructure were removed. Over 90% of the facility is now either paved or covered with buildings.

Releases are believed to have occurred during historical operations (e.g., spills, tanks) associated with the acetylene plant and the slaked lime ponds. Historically site stormwater discharges from the site were documented to contain metals. The site redevelopment in 1996 is believed to have eliminated the stormwater pathway.

Soil and groundwater contamination have been documented at the site. Available groundwater data and the distance to the river (>1000 feet) indicate that it is unlikely that groundwater is migrating from the site to the river.

Comment:			

(06/08/2004 RGS/VCP) DEQ determined that the site is not likely a current source of contamination to the Willamette River and that the site is a low priority for further action. EPA agreed that "this site does not appear to be a current source of contamination to the river" in a letter dated May 18, 2004. DEQ recommends that additional sampling be performed to address data gaps and to further characterize hazardous substance releases in the lime pond, the acetylene plant area, and the TPH contaminated areas. This additional focused sampling is needed to determine the nature and extent of contamination and whether the site poses unacceptable risks to human health and/or the environment.

(03/20/2007 CWH/ICP) DEQ reviewed several reports summarizing site conditions and a Feasibility Study that described remedial alternatives for the site. Based on review of these records DEQ selected a remedy, codified in the Record of Decision, that stipulates the following -
- Maintain the existing cap of the site, which consists of warehouse buildings and asphalted parking area;
- Establish a restriction for all uses of groundwater below the site;
- Establish institutional controls via a site-specific contaminated soil and groundwater management plan to guide site activities as they relate to capped contamination areas;
- Record an Easement and Equitable Servitude with the property deed to establish site hazards, inspection and maintenance of the soil cap, and reporting to DEQ.

The Easement and Equitable Servitude (E&ES) was signed by DEQ and Schnitzer Investment Corp. in February 2007 and recorded with Multnomah County on March 13, 2007 (#2007-043680). Since an E&ES was the selected remedial action, the site will remain on the Confirmed Release List (CRL) and Inventory.

Comment:			

The site lies in an industrialized area. No residentially zoned properties occur within a quarter mile of the site. Because a substantial portion of the site is paved, the risk of exposure to potentially contaminated surface soil appears low. Current or future site workers and utility workers may be exposed to site contaminants in soil during construction or excavation activities. DEQ determined that it is unlikely the site is a current source of contamination to the Willamette River.

Comment:			

The site was identified as a potential source of contamination to the Willamette River based on initial sampling results from a river sediment study. The contamination may have resulted from discharges to city outfalls or shallow groundwater discharging to the river. A Strategy Recommendation completed in December 1999 recommended that an Expanded Preliminary Assessment (XPA) be conducted to evaluate the sediment contamination.

Sediment sampling results from the Portland Harbor revealed elevated levels of barium, cadmium, lead, mercury, silver, zinc, and benzoic acid in sediments adjacent to the site. Elevated levels of metals (zinc, chromium, and lead) and petroleum compounds were documented in subsurface soils in the portion of the site formerly used for storage of lime sludges (the lime pond). This area also had pH readings in the range of 12.5. Acetone, MIBK, and metals were detected in on-site groundwater.

Site soil and groundwater have been impacted with metals, total petroleum hydrocarbons and volatile organic compounds. Polychlorinated biphenyls (PCBs) were detected in several investigations. Metals (arsenic, cadmium, chromium, copper, mercury, lead, and zinc) detected at elevated concentrations in sediments near City of Portland Outfall No. 19 are similar to those detected on-site. Phthalates, polycyclic aromatic hydrocarbons, and PCBs were also detected in sediments near Outfall 19.

The site was identified as a potential source of contamination to the Willamette River based on initial sampling results from a river sediment study. The contamination may have resulted from discharges to city outfalls or shallow groundwater discharging to the river. A Strategy Recommendation completed in December 1999 recommended that an Expanded Preliminary Assessment (XPA) be conducted to evaluate the sediment contamination.

Sediment sampling results from the Portland Harbor revealed elevated levels of barium, cadmium, lead, mercury, silver, zinc, and benzoic acid in sediments adjacent to the site. Elevated levels of metals (zinc, chromium, and lead) and petroleum compounds were documented in subsurface soils in the portion of the site formerly used for storage of lime sludges (the lime pond). This area also had pH readings in the range of 12.5. Acetone, MIBK, and metals were detected in on-site groundwater.

Site soil and groundwater have been impacted with metals, total petroleum hydrocarbons and volatile organic compounds. Polychlorinated biphenyls (PCBs) were detected in several investigations. Metals (arsenic, cadmium, chromium, copper, mercury, lead, and zinc) detected at elevated concentrations in sediments near City of Portland Outfall No. 19 are similar to those detected on-site. Phthalates, polycyclic aromatic hydrocarbons, and PCBs were also detected in sediments near Outfall 19.

Comment:			

(06/08/2004 RGS/VCP) DEQ determined that the site is not likely a current source of contamination to the Willamette River and that the site is a low priority for further action. EPA agreed that "this site does not appear to be a current source of contamination to the river" in a letter dated May 18, 2004. DEQ recommends that additional sampling be performed to address data gaps and to further characterize hazardous substance releases in the lime

pond, the acetylene plant area, and the TPH contaminated areas. This additional focused sampling is needed to determine the nature and extent of contamination and whether the site poses unacceptable risks to human health and/or the environment.

(03/20/2007 CWH/ICP) DEQ reviewed several reports summarizing site conditions and a Feasibility Study that described remedial alternatives for the site. Based on review of these records DEQ selected a remedy, codified in the Record of Decision, that stipulates the following -
• Maintain the existing cap of the site, which consists of warehouse buildings and asphalted parking area;
• Establish a restriction for all uses of groundwater below the site;
• Establish institutional controls via a site-specific contaminated soil and groundwater management plan to guide site activities as they relate to capped contamination areas;
• Record an Easement and Equitable Servitude with the property deed to establish site hazards, inspection and maintenance of the soil cap, and reporting to DEQ.
The Easement and Equitable Servitude (E&ES) was signed by DEQ and Schnitzer Investment Corp. in February 2007 and recorded with Multnomah County on March 13, 2007 (#2007-043680). Since an E&ES was the selected remedial action, the site will remain on the Confirmed Release List (CRL) and Inventory.

Comment:			

The site lies in an industrialized area. No residentially zoned properties occur within a quarter mile of the site. Because a substantial portion of the site is paved, the risk of exposure to potentially contaminated surface soil appears low. Current or future site workers and utility workers may be exposed to site contaminants in soil during construction or excavation activities. DEQ determined that it is unlikely the site is a current source of contamination to the Willamette River.

An Easement and Equitable Servitude (E&ES) was recorded with Multnomah County on March 13, 2007 (#2007-043680, by C. Swick, Deputy Clerk). The E&ES stipulates the following:

Soils and groundwater on the site have been determined to be contaminated with petroleum hydrocarbons and metals, and may have high pH. In a January 25, 2007 memorandum, DEQ's Northwest Region Administrator selected a remedy to address presumed soil contamination present at the site in the Record of Decision for the Property. The remedial action selected requires:

• Worker notification and training program for portions of the Property.
• Inspection and maintenance of the existing site cap consisting of buildings, pavement, and landscape fill.
• Prohibition of use of shallow groundwater beneath the Property.
• Maintaining industrial or commercial land use zoning classifications on the Property.

Comment:

Between 1942 and 1985 an acetylene plant operated on-site. Waste products (slaked lime) were stored in on-site ponds. Two drain fields/septic systems were present on-site between about 1942 and 1971. A drywell is also reported to have existed on-site.

The site was redeveloped in 1996 and the former buildings and infrastructure were removed. Over 90% of the facility is now either paved or covered with buildings.

Narrative Desc:	Manner of Release	***Last Updated on Dt:***	10/22/2015
Created by Init:	RSTRUCK		

Comment:

Releases are believed to have occurred during historical operations (e.g., spills, tanks) associated with the acetylene plant and the slaked lime ponds. Historically site stormwater discharges from the site were documented to contain metals. The site redevelopment in 1996 is believed to have eliminated the stormwater pathway.

Comment:

Soil and groundwater contamination have been documented at the site. Available groundwater data and the distance to the river (>1000 feet) indicate that it is unlikely that groundwater is migrating from the site to the river.
