EXCAVATION CLOSURE APPROVAL CHECKLIST

1. Y (N) Has cleanup been conducted to Matrix standards?
   will be by tomorrow
2. Y (N) Samples results available?
   If yes, final results:

3. Y N Visible soil contamination or odor remaining in excavation? If yes,
   Y N (?) Is a pocket of contamination proposed to be left in place?
4. Y (N) Groundwater in excavation? If yes,
   Y N Water initially in pit, but did not recharge after 24 hours.
   Y N Groundwater has been or will be removed from excavation prior to backfilling.

   Remind service provider that if groundwater encountered, site is subject to CAP requirements. Water must be purged and sampled at recharge.
5. Y (N) Waste oil tank?
   If yes, remind service provider to test for PCBs, solvents, and TCLP metals (have samples just in case).
6. Y (N) Diesel TPH greater than gasoline standard?
   If yes, remind service provider to do HCID (have samples just in case).
7. Y (N) Anything unusual happen/discovered during tank removal or cleanup process?
   If yes, describe briefly:

This file is digitized in ***color*** using Optical Character Recognition (OCR) in a standard PDF format.

Standard PDF Creates PDF files to be printed to desktop printers or digital copiers, published on a CD, or sent to client as publishing proof. This set of options uses compression and downsampling to keep the file size down. However, it also embeds subsets of all (allowed) fonts used in the file, converts all colors to sRGB, and prints to a medium resolution. Window font subsets are not embedded by default. PDF files created with this settings file can be opened in Acrobat and Reader versions 6.0 and later.

GOODMAN BROTHERS INCORPORATED
PO BOX 42490
PORTLAND OREGON 97242

RE: Davis Heating Oil Tank
UST Log Number: 26-91-267
Facility ID No: 6680

Dear Mr. Goodman:

This letter is to confirm the verbal authorization given on July 22, 1991, to backfill or close the excavation located at the facility referenced above, pursuant to OAR 340-162-020(7) or OAR 340-163-020(6). Following completion, a copy of your signed checklist, as required by OAR 340-162-020(5) or OAR 340-163-020(4) and a copy of your final report, as required by OAR 340-122-350 must be submitted to the Department.

This authorization merely signifies that the Department was notified of a proposed excavation closure and was unable to schedule a field inspection at that time.

Authorization to close is not a Department determination that the soil cleanup has been completed in compliance with the requirements of OAR 340, Division 122. Upon a review of the checklist and final report referenced above, the Department will make a final determination on compliance with numeric cleanup standards.

Sincerely,

Tim Todd

(mark only if applicable — tank removed since May 1, 1988)	( )	( )	( )	( )

THANK YOU FOR YOUR ASSISTANCE

THE OREGON REGULATIONS FOR NEW INSTALLATIONS OF UNDERGROUND STORAGE TANKS

Regulations were adopted in January 1988 which set standards for new underground storage tank installations. Tanks and piping must now be designed, constructed and installed to ensure leak prevention. The regulations require controls to prevent:

- Corrosion;
- Damage due to structural failure; and
- Damage due to chemical incompatibility between the tank and the substance stored in it.

Corrosion Control

DEQ regulations identify three different methods of corrosion control.

Cathodic protection—This process reverses the electrical forces that cause corrosion. Cathodic protection systems use either a sacrificial anode or an impressed electrical current. The sacrificial anode system uses zinc or magnesium anodes connected to a coated steel tank. The impressed current system applies an outside electrical current to set up the cathodic protection.

Noncorrosive materials of construction—The law allows tanks and piping to be constructed of noncorrosive materials as an alternative to cathodic protection. The most widely used noncorrosive material is fiberglass reinforced plastic (FRP).

Noncorrosive coating of steel—A steel tank can be coated with fiberglass reinforced plastic to protect it from corrosion. The key factors in the success of this coating include its thickness, insulating strength, durability, and good bonding to the steel.

Structural Integrity

The regulations require that tanks be properly installed so structural failure does not occur. The proper selection and installation of the backfill material used to support the tank are critically important. For FRP tanks, the backfill provides as much as 90 percent of the tank's support. Failure to properly backfill the tank can cause structural damage and result in a leak. Tank manufacturer's installation instructions should be strictly followed.

Chemical Compatibility

The liquid stored in a tank must not dissolve the material of the tank's interior or coating.

Permanent Decommissioning

By regulation, a tank may not be permanently decommissioned unless the owner has applied and paid for a UST permit. Decommissioning must conform to Oregon requirements. An information package on permanent decommissioning is available from the DEQ. There are two approved methods for permanent decommission: Removing the tank or filling it in place with an inert solid. The procedures described in the American Petroleum Institute RP 1604 may be used as guidelines for tank decommissioning. Remove all liquids, solids and sludge from the tank and dispose of them and the tank in an approved manner. If evidence of a release is discovered, the tank owner must notify the DEQ within 24 hours. A cleanup plan will then be developed. Records of the decommissioning process must be kept for at least three years and be available to the DEQ on request.

Reminder

After February 1, 1989, the tank owner cannot deposit or ask anyone to deposit product into tanks which do not have valid DEQ permits.

Approximately March 1, 1988, you should have received a permit application from the DEQ. As of 06/06/88 your application and complete fee have not been received. In order to change the status of your account, please pay the amount indicated above.

If you feel that you do not owe this assessment, please indicate the reason below:

EXEMPT: _____ REMOVED: _____ FILLED: 6/13/88

If you need more space, use the back of this form. You must account for all the tanks that were assessed a fee by DEQ.

If you have already returned the application with all three of the required signatures, you need not sign this form again. Each application requires THREE SIGNATURES: Tank Owner, Property Owner and Permittee, even if this is one person.

This notice may be used if you no longer have the original application form. Please use the original if available. Please contact DEQ at 229-5559 for more information or assistance. Thank you.

OREGON UNDERGROUND STORAGE TANK (UST) SURVEY

The underground storage tank program will soon include performance standards for new tanks and regulations for leak detection/prevention and corrective actions which will affect owners and operators of underground storage tanks. In preparation for these new requirements, the Department has prepared a state-wide survey. The Department requests that owners of underground storage tanks complete the survey questions.

Your response to these questions will assist the Department in developing a cost-effective and responsive state-wide regulatory program. In addition, owners of underground storage tanks may find the survey useful in the management of such tanks.

INSTRUCTIONS

Please type or print in ink all items. Please complete one survey form for each location containing underground storage tanks. Tank I.D. should correspond to Tank I.D. on EPA form 7530-1 for the respective facility location. If more than five tanks are owned at this location, photocopy this survey or request additional forms from DEQ, and staple continuation sheets to this survey.

Notification for Underground Storage Tanks

FORM APPROVED
OMB NO. 2050-0049
APPROVAL EXPIRES 6-30-88

Return To: **Oregon Department of Environmental Quality**
Underground Storage Tank Program
P.O. Box 1760
Portland, Oregon 97207

STATE USE ONLY
I.D. Number 6680
Date Received

GENERAL INFORMATION

Notification is required by Federal law for all underground tanks that have been used to store regulated substances since January 1, 1974, that are in the ground as of May 8, 1986, or that are brought into use after May 8, 1986. The information requested is required by Section 9002 of the Resource Conservation and Recovery Act, (RCRA), as amended.

The primary purpose of this notification program is to locate and evaluate underground tanks that store or have stored petroleum or hazardous substances. It is expected that the information you provide will be based on reasonably available records, or, in the absence of such records, your knowledge, belief, or recollection.

Who Must Notify? Section 9002 of RCRA, as amended, requires that, unless exempted, owners of underground tanks that store regulated substances must notify designated State or local agencies of the existence of their tanks. Owner means—

(a) in the case of an underground storage tank in use on November 8, 1984, or brought into use after that date, any person who owns an underground storage tank used for the storage, use, or dispensing of regulated substances; and

(b) in the case of any underground storage tank in use before November 8, 1984, but no longer in use on that date, any person who owned such tank immediately before the discontinuation of its use.

What Tanks Are Included? Underground storage tank is defined as any one or combination of tanks that **(1)** is used to contain an accumulation of "regulated substances," and **(2)** whose volume (including connected underground piping) is 10% or more beneath the ground. Some examples are underground tanks storing: **1.** gasoline, used oil, or diesel fuel; and **2.** industrial solvents, pesticides, herbicides or fumigants.

What Tanks Are Excluded? Tanks removed from the ground are not subject to notification. Other tanks excluded from notification are:

1. farm or residential tanks of 1,100 gallons or less capacity used for storing motor fuel for noncommercial purposes;
2. tanks used for storing heating oil for consumptive use on the premises where stored;
3. septic tanks;
4. pipeline facilities (including gathering lines) regulated under the Natural Gas Pipeline Safety Act of 1968, or the Hazardous Liquid Pipeline Safety Act of 1979, or which is an intrastate pipeline facility regulated under State laws;
5. surface impoundments, pits, ponds, or lagoons;
6. storm water or waste water collection systems;
7. flow-through process tanks;
8. liquid traps or associated gathering lines directly related to oil or gas production and gathering operations;
9. storage tanks situated in an underground area (such as a basement, cellar, mineworking drift, shaft, or tunnel) if the storage tank is situated upon or above the surface of the floor.

What Substances are Covered? The notification requirements apply to underground storage tanks that contain regulated substances. This includes any substance defined as hazardous in section 101 (14) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA), with the exception of those substances regulated as hazardous waste under Subtitle C of RCRA. It also includes petroleum, e.g., crude oil or any fraction thereof which is liquid at standard conditions of temperature and pressure (60 degrees Fahrenheit and 14.7 pounds per square inch absolute).

Where To Notify? Completed notification forms should be sent to the address given at the top of this page.

When To Notify? 1. Owners of underground storage tanks in use or that have been taken out of operation after January 1, 1974, but still in the ground, must notify by May 8, 1986. **2.** Owners who bring underground storage tanks into use after May 8, 1986, must notify within 30 days of bringing the tanks into use.

Penalties: Any owner who knowingly fails to notify or submits false information shall be subject to a civil penalty not to exceed $10,000 for each tank for which notification is not given or for which false information is submitted.

Underground Storage Tank Program

HEATING OIL TANK SERVICES
SERVICE PROVIDER REPORT CERTIFICATION

FINAL HEATING OIL CLEANUP REPORT FORM

Complete this FINAL report and submit it to the DEQ NWR Eastside office (1550 NW Eastman Parkway, Suite 290, Gresham, OR 97030) **as soon as possible,** but within sixty (60) days from the date the release from a heating oil tank is cleaned up. If this report cannot be submitted within the required time frame, contact DEQ (503-667-8414) to request an extension. OAR 340-177-0055(6)

Property Owner Name: Alan Campf DEQ Cleanup File No.: 26-16-1462

Property Address: 1120 SE Morrison Street

City/State/Zip Code: Portland, OR 97214 County: Multnomah

Owner Phone Number: 503-235-8341

Owner Mailing Address (if different): Same as Above

Licensed Cleanup Service Provider Company: K&S Environmental, Inc.

License Number: 16479 Expiration Date: 3/15/17

11/14/16 Date tank [☑] **removed** or decommissioned [ ] **in-place.** Approx. size of tank: 1000 gallons

(check √ all that apply and provide requested information)

[ ] If tank filled in-place:

What type of fill material was used? _____ How much? _____ gallons

Tank must be completely filled with inert solid material that is compacted and appropriate for site conditions.

[☑] If tank was removed, where was it recycled or disposed of? Metro Metals NW, Inc.

[☑] What national code of practice was followed during decommissioning? API 1604

[☑] Describe how the tank was cleaned as thoroughly as possible to the maximum extent practicable:

Tank was cut open & triple rinsed (by NRC)

[☑] How much product (oil) was removed? 250 gal. Sludge? - 0 - gal. Water? 2000 gal.

[☑] Where was the product/sludge/water recycled? ORRCO Disposed? _____

NRC

_____ Date cleanup **started**. _____ Date cleanup **completed**.

(Check √ Yes or No)

[ ] Yes [ ] No An INITIAL heating oil cleanup report form has already been submitted. *If cleanup had not been started at the time of the initial report, include a new initial report form that has the missing information completed.*

[☑] Yes [ ] No A narrative report is attached.

Complete the rest of this form. Be sure to sign and date page two after answering all questions.

1. How was the release discovered? Describe: tank damaged during street signal installation

2. What initial measures were taken to control the spread of contamination? Describe: the tank was pumped, the tank removed & contaminated soil was excavated

3. What was observed when the tank was removed from the pit or decommissioned in-place? Describe: 2. NRC

4. How much contaminated soil was removed? _____ cubic yards 27,28 tons

5. What was done with the contaminated soil? (check √ all that apply)
☑ Disposed of at: Hillsboro Landfill (name of disposal company)
☐ Treated off-site at: _____ (name of treatment company)
☐ Treated on-site. ATTACH copy of Solid Waste Letter Authorization permit approved by DEQ.
☐ Yes ☐ No On-site treatment of contaminated soil is complete.

6. What actions were taken during cleanup? Describe: UST decommissioning by removal, removal/disposal of PCS & risk-based soil sampling

7. (check √ one) ☐ Yes ☑ No Groundwater was encountered in the tank pit. If yes, ATTACH a separate summary of the data collected and decision made by DEQ in accordance with OAR 340-122-0355(3).

8. What is the highest TPH-Dx concentration measured? 10,900 mg/kg Sample ID No. HOT-South Pit Wall

9. Provide a summary of the concentrations measured in the FINAL round of samples from each sample location.
Note: Write in the specific unit of measurement for each contaminant. Write in "N/A" if sample was not analyzed for a contaminant. Use additional pages as necessary to summarize final results.

Sample ID	Sample Location	NWTPH-Dx Conc. (mg/kg)	B T E or X Detected?	Any PAH's Detected?	Media Soil/Water
			○Yes ○No ○N/A	○Yes ○No ○N/A	
		See Attached Report	○Yes ○No ○N/A	○Yes ○No ○N/A	
			○Yes ○No ○N/A	○Yes ○No ○N/A	
			○Yes ○No ○N/A	○Yes ○No ○N/A	

10. Check the type of remedial option selected for this cleanup project. Include any additional information necessary to satisfy the specific remedial option report requirements. **(check √ only one)**

☐ Soil Matrix OAR 340-177-0065(1)(a) Note: *include matrix score sheet*
☑ Risk-Based OAR 340-177-0065(1)(b)
☐ Generic Remedy OAR 340-177-0065(1)(c)

11. The following information should be ATTACHED as part of this report (list the attachment number you assign for each one):
Attachment Number

☑ Site map, drawn roughly to scale, showing the location of all buildings on the property and on adjacent properties and the location of the heating oil tank. Include distances in feet between objects.

☑ Sketch of the property that clearly shows the sample locations and depths of all soil and/or water samples collected and identifies each location and sample with an unique sample identification code.

☑ Copies of chain-of-custody forms for all soil and water samples collected.
Note: Chain-of-custody forms should include the date, time, and location of each sample collected; the name and company of the person collecting the samples; a description of how the samples were collected, stored, and shipped to the laboratory; and note any problems encountered during the cleanup or sampling process that may have affected sample integrity. Forms should clearly state the address of where samples were collected as a unique identifier.

☑ Copies of all laboratory data reports. Test methods used, including method reporting limits, must be included.

☑ Copies of all receipts or permits related to the disposal of any ☑ **oil / sludge,** ☐ **free product,** ☑ **contaminated soil,** and/or decommissioned ☑ **tank** and ☑ **piping** (check √ all that apply).

☐ Photographs taken at the time of heating oil tank decommissioning and cleanup (not required, but helpful).

"By my signature below, I state that the information contained in this report is true and complete to the best of my knowledge."

CLEANUP CHECKLIST

This checklist is divided into five sections. **Section A must be completed for all cleanup projects.** Complete Sections B, C, D, or E as appropriate for the type of cleanup option selected. The checklist must be filled out as completely as possible and any exceptions noted for the certification to be valid.

GENERAL INFORMATION

Tank Owner Name: Alan Campf

Tank Site Address: 1120 SE Morrison Street
Portland, OR 97214

DEQ Cleanup File Number: 26-16-1462

Date Release Reported: 11/02/16

Licensed HOT Service Provider Company Name: KDS Environmental, Inc.

16479 License Number

3/15/18 Expiration Date

✓ **Check each item as complete and correct.** By checking any of the boxes in this checklist, you are indicating that the statement applies to this project. If there are any exceptions to the statement, please note them in the comment area provided at the end of the checklist. If the statement does not apply, please do not check the box.

NOTE: TPH = Total Petroleum Hydrocarbons as diesel by method NWTPH-Dx

Note: The submittal of this checklist does not replace a final cleanup report

This checklist MUST be signed and dated on page 4

SECTION A - ALL CLEANUP PROJECTS

☑ A1. The release of petroleum was reported to DEQ (OAR 340-163-0020(4)).

☑ A2. No free product is present or was removed during initial abatement actions.

☐ A3. Water is present at the site and DEQ was notified. Please note the name of the DEQ Staff person notified and the date of notification _____.

☑ A4. A site sketch, drawn approximately to scale, is included in the report (OAR 340-122-0345) which clearly shows:

☑ The location of all buildings and other key features, both man-made and natural;
☑ The names of adjacent streets and properties;
☑ The location of all excavations including those that were for the removal of tanks and associated piping as well as those that were strictly for the removal of contaminated soils;
☑ The location of all identified underground storage tanks, including those that were decommissioned as well as those that remain on the site in the vicinity of the cleanup;
☑ All soil and water sample locations including sample depths and analytical results; and
☑ Location of remaining contaminated soil (for risk-based decision making and generic remedy only).

☑ A5. All soil and/or water samples have been properly collected, coded, stored, shipped, and analyzed as required, and chain-of-custody forms have been filled out (OAR 340-122-0218, 340-122-0340 and 340-122-0345).

CHECK EITHER A6a or A6b, NOT BOTH

☑ A6a. Petroleum-contaminated soil has been removed from the property and properly handled, disposed of, or treated.
Amount of soil taken off-site for treatment/disposal: 27.28 tons.
Disposal/treatment location: Hillsboro Landfill

☐ A6b. No petroleum-contaminated soil removal occurred.

☑ A7. A report has been prepared which includes a detailed description of everything that was observed and performed at the site and contains all of the information required by (check ■ one):

☐ OAR 340-122-0360 and OAR 340-177-0055
☐ DEQ's "Heating Oil Tank Generic Remedy Guidance Document" (January 24, 2000)
☑ DEQ's "Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites" (September, 2003)

For Soil Matrix cleanup project, complete Section B.

♦

For Generic Remedy cleanup project, complete Section C.

♦

For Risk-Based cleanup project (simple, soil-only), complete Section D.

♦

Complete Section E for:
All sites where groundwater is encountered and soil matrix standards for closure are not met.
All sites where heating oil tank constituent concentrations exceed the risk based concentrations in Appendix A of the DEQ's "Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites" (September, 2003).

SECTION B - SOIL MATRIX CLEANUP

☐ B8. No contaminated soil exceeding the soil matrix level established for this site remains onsite. If a pocket of contamination exceeding the matrix level remains, use the appropriate checklist in Section C, D, or E instead.

CHECK EITHER B9a or B9b, NOT BOTH

☐ B9a. TPH concentrations were all below 100 mg/kg.

☐ B9b. TPH concentrations greater than 100 mg/kg remain in the soil and a Matrix Score Sheet has been completed. Supporting documentation for the matrix evaluation is included in the report. This project is a (check ■ one):

☐ Level 2 site (500 ppm TPH)
☐ Level 3 site (1,000 ppm TPH)

☐ B10. Groundwater was encountered, but no benzene, toluene, ethylbenzene, and total xylenes (BTEX) or polynuclear aromatic hydrocarbons (PAHs) were detected in water above risk-based concentrations. No BTEX was detected in soil samples collected from the soil/water interface pursuant to OAR-340-122-340.

SECTION C - GENERIC REMEDY

☐ C8. Contamination is limited to soil only, and the remaining contaminated soil is a minimum of ____ feet above the seasonal high groundwater level.

☐ C9. The magnitude and extent of contamination has been clearly delineated both horizontally and vertically to at least 500 mg/kg TPH.

☐ C10. The volume of contaminated soil remaining in the subsurface above 500 mg/kg TPH is less than 65 cubic yards. Volume calculations are included in the cleanup report.

☐ C11. Any contaminated soil left in place is deeper than 3 feet below ground surface.

☐ C12. The maximum heating oil TPH concentration remaining in the soil is less than 10,000 mg/kg. The maximum TPH concentration detected remaining in the soil is _____ (mg/kg).

☐ C13. Contaminated soil left in place is greater than 2,500 mg/kg TPH. A representative soil sample was collected from the most contaminated soil remaining at the site and analyzed for benzene. No benzene was detected in the soil in excess of 0.1 ppm.

SECTION D - SOIL ONLY RISK-BASED EVALUATIONS

☑ D8. Contamination is limited to soil only. The magnitude and extent of heating oil contamination (as TPH), has been clearly delineated vertically and horizontally (OAR 340-122-0240). *Note: It is often a site-by-site decision on the adequacy of this determination. Contact the Department if there are questions on this issue.*

☑ D9. A sample representative of the most contaminated soil remaining at the site was obtained and analyzed. No BTEX or PAHs were detected in the soil in excess of any risk-based concentration in DEQ's "Risk-Based Decision Making for the Remediation of Petroleum Contaminated Sites" (September 2003) guidance document.

SECTION E - GROUNDWATER AND COMPLEX RISK-BASED EVALUATIONS

Note: These certifications are complex and may require Department involvement. Please contact the Department for assistance as appropriate.

☐ E8. The magnitude and extent of heating oil contamination as TPH in soil, and BTEX & PAHs in groundwater, have been clearly delineated vertically and horizontally (OAR 340-122-0240). *Note: It is often a site-by-site decision on the adequacy of this determination. Contact the Department if there are questions on this issue.*

☐ E9. A mass balance calculation for vapor intrusion into the structure of benzene was performed using the air screening model posted on the Department's web page @ www.deq.state.or.us/wmc/tank/ust-lust.htm.

☐ E10. A detailed risk based evaluation has been conducted and the site has been found to be in compliance with OAR 340-122-0205 through 340-122-260. A detailed report documenting the finding has been prepared.

Re: UST Decommissioning and Risk-Based Cleanup for H/O UST
Property Located at 1120 SE Morrison Street, Portland, OR
DEQ File No. 26-16-1462

Dear Mr. Campf:

This report presents the procedures, methods and results of soil sampling performed by K&S Environmental, Inc. (K&S) at the corner of SE Belmont Street and SE 11th Avenue in Portland, OR. The sampling was completed as part of a risk-based evaluation associated with the decommissioning and subsequent soil cleanup of a1000 gallon heating oil underground storage tank (UST) previously completed at the site.

Background

In November of 2016, a 1000 gallon heating oil UST was damaged by City of Portland workers during the installation of a new signal light at the northeast corner of the intersection of SE Belmont Street and SE 11th Avenue in Portland, OR. Diesel product was reportedly released to the subsurface at that time and a release was reported to the DEQ by the City of Portland. NRC Environmental Services (NRC) was contracted at that time to decommission the tank by removal. A total of 27.28 tons of diesel contaminated soil was excavated and disposed of at Hillsboro Landfill during the decommissioning process. Due to physical constraints at the site, the City of Portland instructed NRC to backfill the excavation, and the installation of the new signal light was completed. Prior to backfilling, NRC collected excavation bottom and sidewall soil samples to document conditions at the site. The results of the sampling completed by NRC indicate that diesel contamination in excess of the site's Soil Matrix Cleanup standard remains at the site. The sampling completed by NRC did not adequately define the lateral extent of the remaining soil contamination at the site. Although soil reportedly in excess of 10,000 ppm diesel remains at the site, no constituent testing was performed. In April, 2017, K&S was contracted to perform a risk-based evaluation of the site for possible closure under DEQ's 'Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites' guidance. Documentation made available to K&S for the work completed by NRC is included in this report.

Procedures

On April 12, 2017, K&S arrived at the site and installed a total of five shallow borings and collected soil samples for chemical analyses. The borings were installed in the City right of way, and a permit was obtained from the City of Portland prior to completing the work. A copy of the City permit is included with this report. The borings were installed using a trailer mounted Giddings drill rig that utilizes a 3 inch diameter solid stem auger that is advanced to the desired depth with 1 inch kelly bars. Soil samples were collected for chemical analyses by advancing a

split spoon sampler into undisturbed soil beyond the bottom of the open borehole. The samples were collected using disposable Nitrile gloves, placed into EPA approved 4 once glass jars and then packed for minimal headspace. The jars were labeled and placed on ice for transport to the laboratory accompanied by chain of custody documentation. Soil samples were continually inspected for evidence of petroleum contamination during installation of the five borings. Subsequent to installation of the borings and collection of the soil samples, the boreholes were abandoned by filling the boreholes with medium chip bentonite. The sidewalk was then restored per City of Portland specifications.

The boring locations were determined based upon site conditions and sample collection was designed to obtain lateral definition of the remaining impacted soil. Since no constituent analyses were performed during the initial remedial excavation, K&S attempted to duplicate the worst case soil remaining at the site and perform constituent analyses on that sample. Due to the presence of the new buried signal lines scattered throughout the former excavation (see attached pictures), K&S limited their drilling and sampling to the locations noted on the attached site map.

A total of 11 soil samples were preserved and analyzed from the 5 borings installed by K&S. The samples were collected from the 9-10 foot and 14-15 foot depths in all borings and were analyzed for TPH diesel. Soil cutting were continually inspected during the installation of the borings and the only visual or olfactory evidence of diesel contamination was observed in boring B-2 at the 9-14 foot depth interval. That sample (#4) was analyzed for TPH diesel, BTEX and PAHs. No visual or olfactory evidence of diesel contamination was detected during the installation or sampling of borings B-1, B-3, B-4 and B-5. The results of the soil sampling completed by K&S are summarized below in Tables 1 and 2.

Table 1
Soil Samples Collected on 4/12/17

Sample ID	Location	NWTPH-Dx
#1	Boring B-1, 9 ft.	ND
#2	Boring B-1, 14 ft.	ND
#3	Boring B-2, 9 ft.	119 ppm
#4	Boring B-2, 13 ft.	1980 ppm
#5	Boring B-2, 15 ft.	ND
#6	Boring B-3, 10 ft.	ND
#7	Boring B-3, 10 ft.	ND
#8	Boring B-4, 10 ft.	34.5 ppm
#9	Boring B-4, 15 ft.	ND
#10	Boring B-5, 10 ft.	ND
#11	Boring B-5, 15 ft.	ND

Results of Risk-Based Constituent Analyses

Sample ID	NWTPH-Dx	BTEX (ppm)	PAHs (ppm)
#4, Boring B-2, 13 ft.	1980 ppm	Benzene- <0.0156 Toluene- <0.0778 Ethylbenzene- <0.0389 Xylenes- <0.117	Fluoranthene- 0.020 Fluorene- 0.743 Naphthalene- <0.045 Phenanthrene- 0.0575 Pyrene- 0.0179

ppm - parts per million ND - None detected at or above reportable levels

Field Observations

Subsurface Conditions: The work area is located in the City of Portland sidewalk that consists of 4 inches of concrete. Soil encountered beneath the concrete consists of sandy silt to the total depth explored of 15 feet. The contaminated soil located north of the remedial excavation began at approximately 9 feet and displayed visual and olfactory evidence of diesel contamination. All evidence of diesel contamination was gone by the 14 foot depth. No visual or olfactory evidence of petroleum contamination was encountered in any of the remaining perimeter borings. No groundwater was encountered during the project and is not expected to be encountered prior to 30 feet below ground surface.

Risk-Based Discussion

The site is located in a residential and commercial area of SE Portland, OR, so the Residential Receptor Scenario is being used in evaluating the risk at the site by comparing the constituent analytical results for the site with the Tier 1 RBCs in DEQ's 'Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites'. Since the remaining contamination is first encountered at a depth of approximately 9 feet, the exposure pathway for 'Surface Soil Ingestion and Dermal Contact' was eliminated. Since groundwater was not encountered and is not expected prior to 30 feet at the site, the 'Leachate to Protect Groundwater' scenario was deemed not complete for the site. A review of Oregon Water Resources Department's data base indicates that no water wells are located within several hundred feet of the site. No free product was noted in the soil during the completion of the work at the site. The vertical extent of the remaining soil contamination is limited to 14 feet below the surface, as determined by the soil samples collected during the investigative work completed by K&S and NRC.

The contaminated soil sample collected by K&S, and used as a worst case scenario remaining at the site (1980 ppm diesel), is less than the 10,900 ppm diesel reported by NRC. The presence of the above and below ground utilities in the former tank area makes additional investigation impractical. The absence of BTEX and Naphthalene at low detection levels in sample #4 collected by K&S suggests that the risk-based concentrations for those constituents would likely meet the RBCs for the applicable pathways in the contaminated soil samples collected by NRC.

Inferred Extent of Remaining TPH Contamination in the Soil

Area of remaining impacted soil = 20 ft x 11 ft. = 220 ft^2
Thickness of remaining impacted soil strata = 14 ft. – 8 ft. = 6 ft.
Volume of soil in excess of 500 ppm TPH = 220 ft^2 (6 ft.) = 1320 ft^3 = 49 yd^3

Area of soil removed from the depth interval during remedial excavation = 7 ft.x 14 ft. = 98 ft^2
Depth interval removed – 11 ft. – 8 ft. = 88 ft.
Volume of soil removed = 98 ft^2 x 8 ft. = 784 ft^3 = 29 yd^3

Total Volume of Remaining Impacted Soil = 49 cy -29 cy = 20 CY

Conclusions

In November, 2016, NRC decommissioned by removal a 1000 gallon heating oil UST at the corner of SE Belmont Street and SE 11th Avenue in Portland, OR. A total of 27.28 tons of diesel contaminated soil was excavated and disposed of at Hillsboro Landfill. Soil samples collected

from the final remedial excavation indicated diesel contaminated soil remains in excess of DEQ's Soil Matrix Cleanup standard for the site. Insufficient data was collected prior to backfilling the excavation to properly evaluate the site for regulatory closure.

K&S installed borings and collected soil samples from around the former remedial excavation in April, 2017. Based upon the results of the soil sampling completed by K&S, the site appears to qualify for regulatory closure under DEQ's 'Risk-Based Decision Making for the Remediation of Petroleum Contaminated Sites'.

Included with this report are completed copies of the ODEQ "Heating Oil Risk-Based Soil Cleanup Certification Checklist", K&S Environmental, Inc.'s Service Provider's Heating Oil UST Cleanup Report Form and Project Cost Summary. K&S has registered the UST Decommissioning and Site Cleanup with DEQ by sending a copy of the certification papers and this report to the DEQ's Heating Oil Tank program in Portland, OR accompanied by the registration fee of $200.00.

Please review the findings presented in this report and contact me with any questions or concerns you may have.

Sincerely,

Bill Knutson, P.E.

Notes and Definitions

Qualifiers:

B-02	Analyte detected in an associated blank at a level between one-half the MRL and the MRL. (See Notes and Conventions below.)
F-11	The hydrocarbon pattern indicates possible weathered diesel, or a contribution from a related component.
R-02	The Reporting Limit for this analyte has been raised to account for interference from coeluting organic compounds present in the sample.
V-15	Sample aliquot was subsampled from the sample container. The subsampled aliquot was preserved in the laboratory within 48 hours of sampling.

Notes and Conventions:

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis. Results listed as 'wet' or without 'dry'designation are not dry weight corrected.
RPD	Relative Percent Difference
MDL	If MDL is not listed, data has been evaluated to the Method Reporting Limit only.
WMSC	Water Miscible Solvent Correction has been applied to Results and MRLs for volatiles soil samples per EPA 8000C.
Batch QC	Unless specifically requested, this report contains only results for Batch QC derived from client samples included in this report. All analyses were performed with the appropriate Batch QC (including Sample Duplicates, Matrix Spikes and/or Matrix Spike Duplicates) in order to meet or exceed method and regulatory requirements. Any exceptions to this will be qualified in this report. Complete Batch QC results are available upon request. In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) is analyzed to demonstrate accuracy and precision of the extraction and analysis.
Blank Policy	Apex assesses blank data for potential high bias down to a level equal to ½ the method reporting limit (MRL), except for conventional chemistry and HCID analyses which are assessed only to the MRL. Sample results flagged with a B or B-02 qualifier are potentially biased high if they are less than ten times the level found in the blank for inorganic analyses or less than five times the level found in the blank for organic analyses. For accurate comparison of volatile results to the level found in the blank; water sample results should be divided by the dilution factor, and soil sample results should be divided by 1/50 of the sample dilution to account for the sample prep factor. Results qualified as reported below the MRL may include a potential high bias if associated with a B or B-02 qualified blank. B and B-02 qualifications are not applied to J qualified results reported below the MRL.
---	QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
***	Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

RE: Heating Oil Underground Storage Tank Decommissioning
1120 SE Morrison Street, Portland, Oregon 97214
Trackit Number 1090867, NRC Job Number 108524

This letter summarizes the accompanying report of the heating oil underground storage tank (HOT) decommissioning project recently completed at the above address. The tank in question was taken out of service in the performance of this work.

EXECUTIVE SUMMARY

NRC Environmental Services (NRC) decommissioned by removal one approximately 1,000-gallon heating oil underground storage tank located at the commercial property at 1120 SE Morrison Street, in Portland, Oregon. Following are the results of the tank removal:

- One 1,000-gallon steel underground storage tank was removed from the ground over the period of November 14th to November 16th, 2016 and recycled at a scrap metal facility.
- Approximately 750 gallons of residual fuel and 250 gallons of water was removed from the tank and recycled at an oil recycling facility. An additional 1,250 gallons of water was removed from the tank and tank excavation during the project due to surface runoff.
- Evidence of a release was observed during the decommissioning and reported to Oregon DEQ. LUST log number 26-16-1462 was issued for this release.
- A total of 27.28 tons of contaminated soil was excavated from the subject property and transported for disposal at Waste Management's Hillsboro Landfill.
- Confirmation sampling of soils performed after removal activities indicate that there is petroleum hydrocarbon contamination present above regulatory thresholds in soil below the tank;
- No groundwater was encountered during excavation activities on the subject property;

Because there is a release associated with decommissioning of this tank, NRC recommends that further action be taken in regards to this tank decommissioning. This release has not been cleaned up to the standards contained in Oregon Administrative Rules (OAR 340-122-0250 through 340-122-0630).

Sincerely,

Bob Ransdell

UNDERGROUND STORAGE TANK REMOVAL

A. Introduction

NRC Environmental Services (NRC) decommissioned by removal one 1,000-gallon heating oil underground storage tank uncovered during construction work to repair signal equipment at the northeast corner of SE 11th Avenue and Belmont Street in Portland, Oregon. All work was completed in accordance with local, state, and federal UST regulations, along with typical industry protocols. This report summarizes the tank decommissioning activities and presents the findings of the site assessment associated with this investigation.

B. Licenses and Permits

The Supervisor, Perry Stayton is certified in the State of Oregon to provide underground storage tank Decommissioning services (Decommissioning License #12449, expires 05-11-2017) and Heating Oil Tank services (License #24952, expires 05-11-2017). The Contractor is a licensed Heating Oil Tank Service Provider (License #26680, expires 06-05-2017) and licensed UST Service Provider (License #26253, expires 09-28-2018). Copies of these licenses are provided in Appendix A.

C. Site Background

The subject property is occupied by a commercial warehouse. The tank in question was unknown at the time of its discovery during unrelated construction work. The size, configuration and connections to the tank are consistent with the presumed use to contain heating oil for consumptive use on the premises.

The tank in question was discovered during construction work related to install or repair traffic signal equipment. The tank was partially exposed by these site activities but exposing the remaining tank, pumping, cutting, cleaning and removal of the tank shell and excavation of petroleum-contaminated soil were all supervised by NRC decommissioning supervisors.

D. Tank Removal and Contaminated Soil Excavation:

a. Initial Discovery, November 1st, 2016:

On November 1st, 2016, NRC received notification at 10:58 hours from the City of Portland Bureau of Transportation (PBOT) that an abandoned underground storage tank had be uncovered during unrelated construction activities on the northeast corner of SE 11th Avenue and SE Belmont Street. NRC responded by dispatching a licensed heating oil tank decommissioning supervisor to the site to discuss options for continuing work on the site, arriving on site at 13:50 hours. NRC supervisor Perry L. Stayton observed an approximately 40" deep excavation in the city sidewalk that exposed the top of a steel tank. The tank had been damaged by excavation equipment and some heating oil released. The estimated quantity released was approximately 20 gallons. Refer to the vicinity map of the site included as Appendix B of this report.

NRC mobilized a 70-bbl vacuum truck to the site to remove residual fuel from the tank. A total of 750 gallons of fuel and 200 gallons of water were removed from the tank and placed in totes or drums for temporary storage during characterization. Because the location of the abandoned tank was immediately adjacent to several ballot drop-off boxes which were scheduled to remain in place through the upcoming elections, PBOT representative Adam Moore instructed NRC personnel to

schedule to resume work on the tank system decommissioning after the election. NRC personnel demobilized from the site at 14:30 hours.

A sample of the water and oil was submitted on November 3rd, 2016 for PCB analysis using EPA method 8082 and for regulated metals using EPA method 6020. The results of this analysis is shown in report A6K0205, which is attached as Appendix C of this report and show that no PCBs or regulated levels of metals are present in the waste removed from the tank.

b. Removal Activities, November 14th – 16th, 2016

On November 14th, 2016, NRC mobilized to the project site to oversee decommissioning of this tank by removal using excavation equipment belonging to signal contractor Titan. Additional concrete sidewalk and concrete crosswalk signal footings were cut and removed. Clean overburden soils were removed using excavation equipment and loaded to a Titan dump truck. The tank was found to have filled with water during the intervening period, and a 70-bbl vacuum truck was mobilized to remove water. During removal of clean overburden soils, indications of petroleum-contaminated soil were observed, and contaminated soil was segregated from clean overburden soils. NRC mobilized a roll-off truck and 20-cy roll-off bin to provide temporary storage and approximately 6 cubic yards of petroleum-contaminated soil was removed from the excavation.

On November 15th, 2016, NRC remobilized to the project site to continue exposing the tank. Additional petroleum-contaminated soil was removed and loaded into roll-off bins. The tank interior was checked for flammable or explosive atmospheres and was found to be safe to handle. The top of the tank was cut open and residual tank sludge was removed using the excavator, placing the sludge into the roll-off bin with contaminated soil. The top of the tank was approximately 42 inches below ground surface (bgs). The tank was observed to be 12 feet in length, and 44 inches in diameter.

The tank was removed from the excavation with the excavator. During an inspection of the tank shell after removal, significant corrosion or pitting was noted, and several holes were observed in the tank shell approximately half-way up the side. Subsurface soils in the vicinity of the tank were observed to have signs of a release, including staining, grey color and olfactory indications. Groundwater was not observed at the elevation of the tank bottom in the tank nest. No tank vent piping, supply or return lines were present or required to be removed, but the tank fill piping was in place and was removed with the tank shell.

On November 16th, additional petroleum-contaminated soil was removed from the excavation and soil sampling was conducted. At the request of City of Portland Bureau of Environmental Services representative John O'Donovan, excavation of contaminated soil was halted at approximately 12:00 hours so as to avoid endangering the adjacent roadway or structures and backfill of the excavation was begun. NRC personnel demobilized equipment and personnel from the site.

c. Soil Sampling Activities, November 16th, 2016

At the completion of soil excavation activities, NRC obtained seven samples of soils from the tank excavation, four from sidewalls at a depth of 9' below ground surface (bgs) and three from the excavation bottom. The excavation floor was sampled in two locations at 11' bgs, and a test pit was installed at one of those locations at an elevation 3' deeper than the excavation floor (14' bgs). An additional sample was obtained from contaminated soil as a characterization sample. Soil samples were collected using the excavator bucket.

Soil obtained from the excavator bucket was handled with new pair of disposal nitrile gloves and placed in pre-cleaned 8-oz glass jars with Teflon-lined lids. Sample containers were labeled and placed in a chilled, insulated container for transport under a Chain-of-Custody to the analytical laboratory. Samples were analyzed for petroleum hydrocarbons using the method NWTPH-Dx

(diesel-range petroleum hydrocarbons). Field screening was conducted on soil samples by visual observation and sheen testing. A copy of the report of laboratory analysis is included in Appendix D of this report and summarized in Table 1 below. Refer to maps of the site in Appendix B for locations of soil samples.

Table 1: Results of Soil Sampling Laboratory Analysis

Sample ID	Depth (feet)	Sample Date/ Time	Location	NWTPH-Dx Result (mg/kg)	
				Diesel Range	Heavy Oil Range

E. Waste Management

Approximately 750 gallons of heating oil and 250 gallons of water was removed from the HOT prior to removal of the tank shell. An additional 1,250 gallons of water was removed from the tank shell and excavation during removal due to accumulation of surface runoff in the excavation. This waste was transported for disposal to the Oil Re-Refining facility in Portland, Oregon. Copies of the receiving record for disposal are included as Appendix E of this report.

The steel tank shell was recycled for scrap value at Metro Metals Northwest. A copy of the scrap metal receipt is included as Appendix F of this report. Copies of the landfill scale tickets for disposal of petroleum-contaminated soil are included as Appendix G of this report.

F. Summary

NRC Environmental Services (NRC) decommissioned by removal one approximately 1,000-gallon heating oil underground storage tank located at the commercial property at 1120 SE Morrison Street, in Portland, Oregon. Following are the results of the tank removal:

- One 1,000-gallon steel underground storage tank was removed from the ground over the period of November 14th to November 16th, 2016 and recycled at a scrap metal facility.

- Approximately 750 gallons of residual fuel and 250 gallons of water was removed from the tank and recycled at an oil recycling facility. An additional 1,250 gallons of water was removed from the tank and tank excavation during the project due to surface runoff.
- Evidence of a release was observed during the decommissioning and reported to Oregon DEQ. LUST log number 26-16-1462 was issued for this release.
- A total of 27.28 tons of contaminated soil was excavated from the subject property and transported for disposal at Waste Management's Hillsboro Landfill.
- Confirmation sampling of soils performed after removal activities indicate that there is petroleum hydrocarbon contamination present above regulatory thresholds in soil below the tank;
- No groundwater was encountered during excavation activities on the subject property;

Because there is a release associated with decommissioning of this tank, NRC recommends that further action be taken in regards to this tank decommissioning. This release has not been cleaned up to the standards contained in Oregon Administrative Rules (OAR 340-122-0250 through 340-122-0630). Refer to photos of tank decommissioning activities included as Appendix F of this report.

Sincerely,

Bob Ransdell

Re: File No: 26-16-1462

Dear Mr. Kortenhoff:

K&S Environmental recently submitted a heating oil underground storage tank certification and report pertaining to property located at 1120 SE Morrison Street in Portland, OR. Please note that this certification and report was prepared for Campf Properties Limited Partnership, which is the owner of the property, rather than Mr. Alan Campf individually. Accordingly, we would appreciate DEQ re-issuing the May 5, 2017 correspondence in which DEQ states it has registered the certification and report and closed DEQ's file, so that it is addressed to the following. The revised certification papers are included.

Campf Properties Limited Partnership
Attn. Alan Campf
1120 SE Morrison
Portland, OR 97214

Thank-you,

Bill Knutson

RE: Campf, Alan
File No.: 26-16-1462

A release was reported from an underground heating oil tank (HOT) system located at 1120 SE Morrison St in PORTLAND, Oregon. As the responsible party for the property, you are required to clean up the heating oil release according to Oregon Administrative Rules (OAR) OAR 340-177-0001 through OAR 340-177-0095. These rules require cleaning up the soil, groundwater, surface water, soil vapor, and any other media contaminated by heating oil to the appropriate standards or demonstrating that the contamination does not pose a risk to human health or the environment.

Please reference the Department of Environmental Quality (DEQ) File Number listed on this letter in all future correspondence and reports.

A copy of the HOT cleanup regulations will be provided upon request by calling 1-800-742-7878. This information is also available at DEQ's web site, http://www.deq.state.or.us/lq/tanks/index.htm As the responsible party, you should be aware of the requirements for cleanup, even if you have hired a licensed contractor to assist you.

Any contractor hired to perform assessment, decommissioning, or cleanup activity must be a DEQ Licensed HOT Contractor. Licensed contractors are required to have insurance and certify that their projects meet criteria established by DEQ. After the project has been certified, the Department may audit the cleanup. Audits typically take place within two years of completion of the project and involve a detailed review of the cleanup project. Exceptions to the two-year time frame could occur when major problems are noted with a contractor's work. When a cleanup has been improperly certified, the DEQ will require the contractor and the client to resolve the outstanding issues and to re-certify the cleanup.

Projects requiring long term monitoring, treatment, or engineering controls are encouraged to enter into a technical assistance agreement to complete a cleanup that meets the standards of Oregon Revised Statute (ORS) 465.315. For information regarding complex site cleanup, please visit DEQ's web site, http://www.deq.state.or.us/lq/tanks/hot/index.htm.

Property owners or contractor on owner's behalf must register their project certification with DEQ. This is accomplished by sending the certification and the report on the cleanup to DEQ with a $200 registration fee. Once the DEQ receives this information, it registers the certification and sends a letter acknowledging receipt of this information. This usually occurs within two weeks of receiving all of the required information.

Conditions

1.This permit is for the use of the street area only, and shall not exempt the permittee from obtaining any license or permit required by the City Code or Ordinances for any act to be performed under this permit, nor shall this permit waive the provisions of any City Code, Ordinance, or the City Charter, except as herein stated.
2.This permit is revocable by the Director of Transportation at any time in the event the public's need requires it, or the permittee fails to comply with the conditions of this permit, and no expenditure of money hereunder, lapse of time, or other act or thing shall operate as an estoppel against the City of Portland, or be held to give the permittee any vested or other right. Upon the expiration of this permit, or upon its sooner revocation by the Director of Transportation, the permittee shall, within 30 days, remove said installations from the street area and restore the street area as directed by and to the satisfaction of the Director of Transportation.
3.The permittee shall hold the City of Portland, its officers, agents, and employees free and harmless from any claims for damages to persons or property, including legal fees and costs of defending any actions or suits, including any appeals, which may result from the permitted activity.
4.This permit is personal to the permittee and may not be transferred, assigned or otherwise conveyed, and will require insurance with limits of coverage that will meet the maximum requirements for liability of a public body as set forth in ORS 30.260 through 30.300, or as it may be required by subsequent amendment and naming the City, its officers, agents and employees as additional insured. Said insurance is to be kept in full force and effect at all times. This permit is automatically revoked without further action by the Director of Transportation if this insurance is permitted to lapse, is canceled, or for any other reason becomes inoperative.
5.The permittee shall provide an annual street opening bond in the penal sum of TWO THOUSAND AND NO/100 DOLLARS ($2000.00) as provided by Section 17.32.040 of the Code of the City.
6.The permittee shall initiate construction authorized by this permit within 30 days of the permit issue date. If the permitted work has not begun within 90 days, the permittee shall reapply for a permit before beginning any work within the right-of-way.
7.ATTENTION: Oregon law requires you to follow rules adopted by the Oregon Utility Notification Center. Those rules are set forth in OAR 952-001-0010 through OAR 952-001-0090. You may obtain copies of the rules by calling the center. (Note: the telephone number for the Oregon Utility Notification Center is 1-800-332-2344). Utilities shall be notified and have an opportunity to locate their facilities at least two days prior to commencing work allowed under this permit.
8. Permittee shall provide a copy of any test-hole reports to the Director of Transportation upon completion of work. The reports shall show the location of each test-hole or well and shall include a copy of the boring log if requested by the Director of Transportation or his representative.

Hi Kylie,

Please see attached for a cover letter and permit request form for removal of an underground storage tank. I might be missing some things, but I'd like to get the ball rolling on this since time is of the essence, and we need to get this tank removed ASAP.

Thanks,
Adam

Hi Kylie,

Do you happen to have an example of a completed tank decommission permit packet? Especially one similar to this situation, which is a city-contracted contractor requesting the permit (I'm actually the one filling out the permit).

Thanks for your help,
Adam

Requesting a permit for removal of an underground heating oil tank on the northeast corner of SE 11th Ave & SE Belmont St along SE 11th Ave. The cylindrical tank is located under the sidewalk, parallel to the roadway, flush with the curb. The curb and a portion of the street will need to be excavated along with the sidewalk above the tank.

The decommissioning needs to occur as soon as possible. Time is of the essence due to ongoing traffic signal construction at the intersection. The contractor performing the work will be Titan Utilities, LLC, in conjunction with NRC Environmental Services.

Final approval	Partial Approval	Approved w/ corrections	Not approved	Cancelled

Inspector/Date:

Conditions

1.This permit is for the use of the street area only, and shall not exempt the permittee from obtaining any license or permit required by the City Code or Ordinances for any act to be performed under this permit, nor shall this permit waive the provisions of any City Code, Ordinance, or the City Charter, except as herein stated.
2.This permit is revocable by the Director of Transportation at any time in the event the public's need requires it, or the permittee fails to comply with the conditions of this permit, and no expenditure of money hereunder, lapse of time, or other act or thing shall operate as an estoppel against the City of Portland, or be held to give the permittee any vested or other right. Upon the expiration of this permit, or upon its sooner revocation by the Director of Transportation, the permittee shall, within 30 days, remove said installations from the street area and restore the street area as directed by and to the satisfaction of the Director of Transportation.
3.The permittee shall hold the City of Portland, its officers, agents, and employees free and harmless from any claims for damages to persons or property, including legal fees and costs of defending any actions or suits, including any appeals, which may result from the permitted activity.
4.This permit is personal to the permittee and may not be transferred, assigned or otherwise conveyed, and will require insurance with limits of coverage that will meet the maximum requirements for liability of a public body as set forth in ORS 30.260 through 30.300, or as it may be required by subsequent amendment and naming the City, its officers, agents and employees as additional insured. Said insurance is to be kept in full force and effect at all times. This permit is automatically revoked without further action by the Director of Transportation if this insurance is permitted to lapse, is canceled, or for any other reason becomes inoperative.
5.The permittee shall provide an annual street opening bond in the penal sum of TWO THOUSAND AND NO/100 DOLLARS ($2000.00) as provided by Section 17.32.040 of the Code of the City.
6.The permittee shall initiate construction authorized by this permit within 30 days of the permit issue date. If the permitted work has not begun within 90 days, the permittee shall reapply for a permit before beginning any work within the right-of-way.
7.ATTENTION: Oregon law requires you to follow rules adopted by the Oregon Utility Notification Center. Those rules are set forth in OAR 952-001-0010 through OAR 952-001-0090. You may obtain copies of the rules by calling the center. (Note: the telephone number for the Oregon Utility Notification Center is 1-800-332-2344). Utilities shall be notified and have an opportunity to locate their facilities at least two days prior to commencing work allowed under this permit.
8.The permittee will protect public facilities in the right-of-way. The permittee will restore public facilities and guarantees the cost for repairs or replacement of any private or public facilities or private property damaged or destroyed caused in whole or in part as a result of work performed under this permit. The permittee recognizes and agrees the City cannot guarantee the accuracy of location of utilities in the street; and permittee further agrees to be responsible for any and all damage caused by his work under this permit, although such damage or destruction may have resulted in whole or in part because of the City's mislocation or misinformation in relation to the utilities.
9.Permittee shall obtain street use permits for areas equipment will be parked and will obtain permits for lane closures and for full street closures in advance.
10.Permittee shall maintain a minimum four foot pedestrian way or the sidewalk shall be closed at each end of the block with barricades and with signs "Sidewalk Closed-Use Opposite Side".
11.Permittee shall protect the work area by barricading or installing a fence adjacent to the excavation area as directed by the Director of Transportation.
12.Permittee shall conform to their approved traffic control plan for this project and shall not block travel lanes unless a traffic control plan for lane closure has been approved by the Traffic Engineer.
13.Permittee shall comply with Title 10 of the City Code, including all erosion measures and signs.
14.If, during construction allowed under this permit, it becomes necessary or expedient to modify the plan or location of any item authorized by this permit, the permittee shall first obtain the approval of the Director of Transportation.
15.After measurements and/or samples are obtained the boreholes will be filled and sealed to match the surrounding surface.
16. Permittee shall provide a copy of any test-hole reports to the Director of Transportation upon completion of work. The reports shall show the location of each test-hole and shall include a copy of the boring log if requested by the Director of Transportation or his representative.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.** Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction orforecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

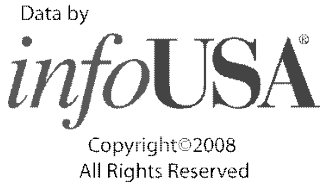
Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1924 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.



RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by GeoDesign Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Sanborn® Library search results

Certification #: 9F02-4876-AE78

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

GeoDesign Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

These permits were generated by the Fire Bureau from 1936-1990 to inspect the installation and renovation of above ground and underground residential storage tanks

There are many areas that are within the City limits today, but were outside the city limits when the tank work was performed. We do not have any permits for those addresses (east of 92nd Avenue, south of SE Foster Rd, north of Columbia Blvd, Maywood Park, Rose City)

Even though permits were required by the Fire Bureau, we might not have one for a particular address because it was lost or the owner never filed one. We always recommend having a tank locate performed in addition to searching this database. You can access a list of ODEQ-licensed tank companies at www.deq.state.or.us . Click on "Programs", then "Heating Oil Tanks."

The permits are for installation and/or renovation, NOT decommissioning/removal. The City has never required permits to decommission/remove a tank on private property. If your tank is in the street/sidewalk, then it's in the Right-of-Way, and you would need a street/sidewalk opening permit from PDOT. If the tank has leaked, and it was reported to ODEQ, then they will have a file on it at the website listed above.

Still have questions? Contact the Oregon DEQ at 503-229-5263

- Pornography/Obscene Material (0)
- Prostitution Offenses (0)
- Weapon Law Violations (0)

Data Range: 03/04/2018 - 03/03/2019

Reported crime counts are aggregated across hexagonal 1/8 mile grid sections of the city, and do not represent the number of reported crimes on a specific tax lot. Points on the map are generalized to the midblock point and may represent the location of multiple reported crimes. The locations of certain crimes are not shown on the map due to privacy concerns, but are included in counts and averages.

The records depicted give a general picture of crime events in the surrounding area and are not official crime statistics. Some information displayed is currently under review and may change subject to record finalization. For greater detail about each record, visit Portland Police Bureau's Open Data Portal and download offense data directly from the Crime Statistics Dashboard.

These permits were generated by the Fire Bureau from 1936-1990 to inspect the installation and renovation of above ground and underground residential storage tanks

There are many areas that are within the City limits today, but were outside the city limits when the tank work was performed. We do not have any permits for those addresses (east of 92nd Avenue, south of SE Foster Rd, north of Columbia Blvd, Maywood Park, Rose City)

Even though permits were required by the Fire Bureau, we might not have one for a particular address because it was lost or the owner never filed one. We always recommend having a tank locate performed in addition to searching this database. You can access a list of ODEQ-licensed tank companies at www.deq.state.or.us . Click on "Programs", then "Heating Oil Tanks."

The permits are for installation and/or renovation, NOT decommissioning/removal. The City has never required permits to decommission/remove a tank on private property. If your tank is in the street/sidewalk, then it's in the Right-of-Way, and you would need a street/sidewalk opening permit from PDOT. If the tank has leaked, and it was reported to ODEQ, then they will have a file on it at the website listed above.

Still have questions? Contact the Oregon DEQ at 503-229-5263

PHASE I ENVIRONMENTAL SITE ASSESSMENT OWNER/OCCUPANT QUESTIONNAIRE

Project Number	MillCreek-19-01-01
Project Name	Modera Morrison
Location	1120 SE Morrison Street, Portland, OR

Please answer the following questions ***to the best of your knowledge***. If the answers to any of the questions are "yes", or if you need to provide further explanation to any "no" answers, please provide additional detail in the space below each question.

1. To your knowledge, has the property or adjacent properties ever been used for industrial purposes, including use as a petroleum service station/bulk plant, automobile repair, commercial printing, dry-cleaning, and/or hazardous waste storage, treatment, or disposal facility?

   X No ☐ Yes

   If yes please explain: _____

2. To your knowledge, is there now or was there formerly any petroleum, chemical or hazardous material use, storage, treatment, or disposal on the property or on adjacent properties (including petroleum products, pesticides, paint, solvents, etc.)?

   ☐ No **X** Yes

   If yes please explain: Storage, We bought and resold industrial lubricants from Fuchs. Underground gasoline storage tanks were decommissioned in 1991, see paperwork previously provided to buyer. Around 2016 the city punctured a heating oil tank (HOT) that was located under the sidewalk on the Southwest corner of the property. See paperwork previously provided to buyer. Early in 2019, asbestos was discovered in flooring material in space currently used as office.

3. To your knowledge, is there now or was there formerly any underground storage tanks (USTs), aboveground storage tanks (ASTs), or 55-gallon drums on the property?

   ☐ No **x** Yes

   If yes please explain: See response above and previously provided paperwork to buyer.

4. To your knowledge, has any fill material been imported to the project site?

   ☐ No **X** Yes

   If yes please explain: See paperwork provided in response to number 2 above.

GEODESIGN INC

5. To your knowledge, are there any water supply wells, drywells, or groundwater monitoring wells, on the property?

X No ☐ Yes

If yes please explain: _____

6. To your knowledge, are there any sumps or floor drains on the property?

☐ No **X** Yes

If yes please explain: Floor drain. I believe there is one in the bathroom.

7. To your knowledge, are there any active or historic septic systems on the property?

X No ☐ Yes

If yes please explain: _____

8. Are you aware of any environmental liens associated with the property?

X No ☐ Yes

If yes please explain: _____

9. To your knowledge, have there been any spills or releases of any hazardous substance or petroleum products on the project site?

☐ No **X** Yes

If yes please explain: See paperwork provided in response to number 2 above.

10. To your knowledge, has the property historically been used for any agricultural purposes?

X No ☐ Yes

If yes please explain: _____

If so, are you aware of any pesticide use, storage, or mixing on the property?

☐ No ☐ Yes

If yes please explain: _____

_____

11. Are you aware of any previous completed environmental reports completed for the project site, including any previous Phase I ESA reports, Environmental Audits, or subsurface investigation reports?

☐ No **X** Yes

If yes please explain: See paperwork provided in response to number 2 above.

_____

If yes can you provide reports to GeoDesign via email: _____

12. Are you aware of any previous or existing environmental permits associated with the property, including but not limited to hazardous waste permits, underground injection control permits, storage tank permits, wastewater permits, or storm water discharge permits?

☐ No **X** Yes

If yes please explain: See paperwork provided in response to number 2 above.

_____

13. What has been the historical use of the project site? Please provide any additional information that may be pertinent to this study:

Bradley Pie was here before we were. We sold paper products, janatorial supplies and tobacco products.

AC	asphalt concrete
AST	aboveground storage tank
ASTM	American Society for Testing and Materials
BGS	below ground surface
BS	blank spike
BSD	blank spike duplicate
CFSL	Clean Fill Screening Level
DEQ	Oregon Department of Environmental Quality
EPA	U.S. Environmental Protection Agency
ESA	Environmental Site Assessment
FINDS	Facilities Index System/Facility Registry System
HREC	historical recognized environmental condition
I.D.	identification
IDW	investigation-derived waste
LUST	Leaking Underground Storage Tank
mg/kg	milligrams per kilogram
mg/L	milligrams per liter
MRL	method reporting limit
MS	matrix spike
MSD	matrix spike duplicate
MTBE	methyl tertiary butyl ether
NA	not applicable
NE	not established
OWRD	Oregon Water Resources Department
PAH	polycyclic aromatic hydrocarbon
PCB	polychlorinated biphenyl
PCE	tetrachloroethene
PID	photoionization detector
ppm	parts per million
PRT	Post Run Tubing
QC	quality control
RBC	risk-based concentration
RBDM	*Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites*
RCRA	Resource Conservation and Recovery Act
REC	recognized environmental condition
RGA	Recovered Government Archive
ROW	right-of-way
RPD	relative percent difference
SWMP	Soil Water Management Plan
TCE	trichloroethene
TCLP	Toxicity Characteristic Leaching Procedure
TMB	trimethylbenzene
UCL	upper confidence limit

µg/m^3	micrograms per cubic meter
UST	underground storage tank
VOC	volatile organic compound

1.0 INTRODUCTION

This report summarizes the results of a Phase II ESA conducted at the Modera Morrison site located at 1120 SE Morrison Street in Portland, Oregon (Property). The 0.86-acre Property includes Tax Lot 5100 of Multnomah County Tax Map 1S1E02BA. The Property includes the entire city block (Block 245) located southeast of the intersection of SE Morrison Street and SE 11th Avenue. The Property is currently occupied by a 19,593-square-foot commercial structure and an AC-paved parking lot.

Based on preliminary information provided by Mill Creek Residential Trust, GeoDesign understands that the proposed development will include demolition of the existing structure and construction of a new mixed-use building consisting of ground floor (first floor above the parking level) retail spaces, building services, common areas, and apartment units and apartment units on levels two through seven. The proposed building will be seven stories tall with one level of underground parking on the west side of the structure and two levels of underground parking on the east side of the structure.

The Property is shown relative to surrounding physical features on Figure 1. The Property layout is shown on Figure 2. Acronyms and abbreviations used herein are defined above, immediately following the Table of Contents.

2.0 BACKGROUND AND REGULATORY STATUS

Our review of historical sources from 1889 through 2019 indicated that the Property was vacant land until sometime prior to 1901. By 1901 a residence was constructed on the southeast portion of the Property. By 1909 additional residences and a telephone office had been constructed. By 1924 a pie bakery was constructed on the southwestern portion of the Property. By 1969 the residences were demolished and a parking lot was constructed. By 2005 the Property was occupied by AJP Northwest and A&S Marketing. The Property has remained relatively unchanged since that time. The Property currently consists of office space and a warehouse for the storage and sale of paper products, janitorial supplies, and tobacco products.

According to information obtained during GeoDesign's Phase I ESA, the following two LUST file numbers pertain to the Property: 26-16-1462 and 26-91-0267. In addition, the Property is listed on the DEQ RGA LUST and DEQ UST databases and the EPA FINDS database. The DEQ RGA LUST database contains a list of leaking UST incidents derived from historical databases and includes many records that no longer appear in current government lists. The DEQ UST database includes a listing of facilities with registered USTs. The Property is identified on the DEQ UST database as UST Facility I.D. 6680. The EPA FINDS database is an inventory or reference list and does not imply a release or REC at the Property. Further information regarding the LUST files and the UST database listing are summarized in Section 3.0.

3.0 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

GeoDesign performed a Phase I ESA of the Property in 2019. The results of the Phase I ESA are summarized in the Phase I ESA report prepared by GeoDesign dated May 16, 2019. The May 16, 2019 Phase I ESA revealed the following:

- Residual petroleum hydrocarbons and related constituents in soil associated with a former heating oil UST located in the sidewalk adjacent to the southwest portion of the Property (LUST File No. 26-16-1462) represents a REC at the Property.
- LUST File No. 26-91-0267 associated with two former gasoline USTs located on the northwest portion of the Property represents an HREC at the Property.
- The historical presence of a decommissioned in-place UST on the Property represents a REC at the Property.
- Historical records of one heating oil UST and one heating oil AST located on the Property represent a REC in connection with the Property.
- Evidence of two USTs located in the sidewalk along SE Belmont Street adjacent south of the Property and one UST located in the parking lot on the east portion of the Property represents a REC at the Property.
- Chemical constituents identified in groundwater beneath the Piacentini Property, located approximately 130 feet southeast of the Property (upgradient of the Property relative to the groundwater flow direction), represents a REC at the Property. Based on our review of environmental information for surrounding sites, it is possible that chemical constituents may be present in groundwater beneath the Property from multiple off-site sources
- A suspect circular feature was observed in the east-central portion of the Property's main parking lot and could not be ruled out as a possible drywell.

Based on the results of the Phase I ESA, GeoDesign recommended conducting a Phase II ESA at the Property (including a geophysical survey) to evaluate potential releases from the former and existing on- and off-site USTs and the potential drywell. GeoDesign also recommended that the Phase II ESA should include a clean fill evaluation to evaluate the quantity of soil that may need to be disposed of as solid waste if exported during future redevelopment.

4.0 SCOPE OF SERVICES

The purpose of the Phase II ESA was to evaluate the nature and extent of potential chemical constituents in various media at the Property. The Phase II ESA scope of services was developed to evaluate the RECs identified during the Phase I ESA and to confirm the presence or absence of the on- and off-site USTs and the potential drywell. In addition, the Phase II ESA was conducted to evaluate chemical constituents in soil with respect to risk to human health (by comparison to DEQ RBCs) and with respect to DEQ CFSLs to estimate the quantity of soil that may need to be disposed of as solid waste if exported during future redevelopment. The specific scope of services conducted at the Property included the following:

- Coordinated and managed the field investigation, including utility checks, Property access authorizations, access preparations, and scheduling subcontractors and GeoDesign field staff.
- Subcontracted a geophysical surveyor to conduct a geophysical survey in the accessible exterior portions of the Property to evaluate for the presence of magnetic anomalies (including potential USTs) and drywells.
- Contacted the Oregon Utility Notification Center to mark the locations of public utilities beneath the ROWs surrounding the Property.
- Subcontracted a private utility locator to clear an approximately 10-foot radius around each proposed boring location.
- Subcontracted ESN Northwest Inc. of Olympia, Washington, to advance 17 direct-push borings (DP-1 through DP-17) to depths of up to 30 feet BGS.
- Advanced two hand auger borings (HA-1 and HA-2) to depths of 16 feet and 10 feet BGS, respectively, using hand-held equipment owned and operated by GeoDesign.
- Collected continuous soil samples from each boring for visual evaluation and field screening. Field screening consisted of visual observation, water sheen testing, and headspace vapor measurements using a hand-held PID.
- Based on the results of field screening and/or the boring locations relative to features of interest (such as the USTs and the suspect circular features), submitted two soil samples from borings DP-5, DP-6, DP-7, DP-11 and DP-12 and one sample from hand auger boring HA-1 for hydrocarbon identification analysis by Method NWTPH-HCID. In addition, submitted up to three soil samples from each boring (except DP-17) for analysis of one or more of the following:
  - VOCs by EPA Methods 5035A/8260C
  - PCBs by EPA Method 8082A
  - RCRA 8 total metals by EPA Method 6020A (ICP-MS)
  - Leachable lead by EPA Methods 1311/6020A (ICP-MS)
  - PAHs by EPA Method 8270D SIM
- Advanced two additional borings (SG-1 and SG-2) for the purpose of collecting soil gas samples and collected one sub-slab vapor sample (SV-1) to evaluate potential future vapor intrusion conditions as follows:
  - Advanced the Geoprobe PRT system to a predetermined depth in SG-1 and SG-2 using equipment owned and operated by ESN Northwest Inc. of Olympia, Washington.
  - Drilled a ¼-inch-diameter hole through the concrete floor slab of the basement using equipment owned and operated by GeoDesign to facilitate collection of sub-slab vapor sample SV-1.
  - Connected new Teflon® tubing to the PRT system (for SG-1 and SG-2) and the new Teflon® tubing advanced below the concrete floor slab (for SV-1) to laboratory-supplied summa canisters.
  - Sealed the annular spaces between the vapor point and the boring sidewall and between the tubing and the concrete floor slab with hydrated bentonite to minimize ambient air migration into the sampling zone.
  - Installed a leak-check system at the soil gas and sub-slab vapor sample locations.

    - Collected the soil gas samples and the sub-slab vapor sample using 1-liter summa sample canisters with in-line filters (2 microns) and flow controllers (less than 200 milliliters per minute). The initial and final vacuum pressures of each summa canister were measured and recorded on the laboratory chain-of-custody form.
- Submitted the soil gas samples to a chemical analytical laboratory for analysis of gasoline-range hydrocarbons and VOCs by EPA Method TO-15.
- Following sampling, abandoned each borehole in accordance with OWRD rules and regulations and repaired the ground surface, as appropriate.
- Placed soil cuttings and decontamination water in Department of Transportation-approved drums for temporary storage at the Property and pending disposal at an approved facility.
- Summarized the results of the Phase II ESA in this report.

5.0 FIELD ACTIVITIES

Field activities were performed on May 4, 11 and 15, 2019 and included (1) a geophysical survey, (2) collecting soil samples from 16 direct-push soil borings (DP-1 through DP-16) and two hand auger borings (HA-1 and HA-2) for chemical analysis, and (3) collecting soil gas samples from two borings (SG-1 and SG-2) and a sub-slab vapor sample (SV-1) for chemical analysis. Upon completion of all sampling activities the borings were backfilled in accordance with OWRD rules and regulations and the ground surface was patched. The locations of borings DP-1 through DP-16, hand auger borings HA-1 and HA-2, and soil gas borings SG-1 and SG-2, and sub-slab vapor point are shown on Figure 2. A description of our field procedures is summarized in Appendix A. The geophysical survey and soil, soil gas, and sub-slab vapor sampling activities are described below.

5.1 GEOPHYSICAL SURVEY

On May 4, 2019 Pacific Geophysics of Portland, Oregon, conducted a geophysical survey of the exterior portions of the Property (including the adjacent sidewalks) using ground penetrating radar and radio detection transmitter equipment. The objective of the geophysical survey was to (1) identify the location, depth, and orientation of two known USTs beneath the sidewalk adjacent south of the Property; (2) confirm the removal of the gasoline USTs in the small parking lot/loading dock area at the northwest corner of the Property; (3) identify the location, depth, and orientation of the suspected decommissioned in-place UST immediately east of the Property structure in the main parking lot; (4) determine the location of the piping associated with a catch basin located in the small parking lot/loading dock area; (5) determine the location of the piping associated with a catch basin located in the main parking lot; and (6) evaluate two suspect circular features in the main parking lot (potential drywells). The report prepared by Pacific Geophysics, dated May 17, 2019, is presented in Appendix B. The results of the geophysical survey are briefly summarized below.

5.1.1 USTs – South Adjacent Sidewalk

Two off-site USTs were confirmed located beneath the sidewalk adjacent south of the Property (Figure 2). The access ports to both USTs were opened, revealing brick-lined manways to secured lids on the top of the USTs. The lids could not be opened at the time of the survey, and the depths to the bottom of the USTs could not be measured. The top of the USTs were measured between approximately 4 and 5 feet BGS. Based on the results of the geophysical

survey, the western UST is approximately 15 feet long and the eastern UST is likely similar in length (as underground utilities prevented an accurate location of the east end of the eastern UST). The width of both USTs appears to be approximately 4 to 5 feet. Therefore, it is likely the bottoms of the USTs are approximately 8 to 10 feet BGS.

5.1.2 Removed USTs – Small Parking Lot/Loading Dock Area

The geophysical survey did not reveal the presence of metallic objects within the area of the asphalt patch (Figure 2) visible at the surface of the parking lot/loading dock area. Reflections typical of a UST excavation were observed across the patch. Although several tank-like reflections were observed in parallel profiles conducted at the east end of the assumed former UST pit, corresponding magnetic anomalies were not observed. The reflections were irregular in the profiles conducted in a perpendicular direction. The geophysical survey report indicates that it is unlikely the reflections are from a UST and are more likely debris, but the existence of a non-metallic tank cannot be ruled out. Given the historical information reviewed and summarized in GeoDesign's Phase I ESA report, dated May 16, 2019, it is likely the two former gasoline USTs were removed as previously reported by others.

5.1.3 On-Site Decommissioned In-Place UST – Main Parking Lot

The location and orientation of one on-site UST was identified in the main parking lot immediately east of the Property structure (Figure 2). The fill port and access port to the UST were located and opened. The cap to the fill port was removed and the depth of the UST and residual product were gauged. The top of the UST is approximately 4.6 feet BGS, the bottom of the UST is approximately 11 feet BGS, and approximately 2.75 feet of sludge was measured in the UST at the location of the fill port. Granular backfill material was observed to the top of the access port. Presumably, this material was used to "decommission" the UST in place in 1988. The length of the decommissioned in-place UST could not be accurately determined due to interference from nearby parked vehicles.

It is possible this UST is the same UST that was documented as decommissioned in place in DEQ's files that were reviewed as part of GeoDesign's Phase I ESA. However, since detailed documentation regarding the former location of the decommissioned in-place UST were not available or provided, GeoDesign cannot be certain the observed decommissioned in-place UST at the Property is the same decommissioned in-place UST noted in DEQ's files.

5.1.4 Catch Basin Piping Route – Small Parking Lot/Loading Dock Area

The outflow pipe from the catch basin in the small parking lot/loading dock area extends toward the southwest, beneath the loading dock and likely connects to previously marked storm sewer pipes identified by the City of Portland located beneath the sidewalk adjacent west of the Property (Figure 2). The geophysical survey corroborates the information obtained from James Hyatt (engineering technician with the City of Portland Bureau of Environmental Services) in an interview conducted during our Phase I ESA. Mr. Hyatt indicated that the City of Portland has records of catch basins permitted on the Property that connect to the Property's sewer line and likely discharge to the City of Portland's combined sewer system.

5.1.5 Catch Basin Piping Route – Main Parking Lot

The outflow pipe from the catch basin in the central portion of the main parking lot extends toward the south for several feet, then elbows approximately 90 degrees, and extends toward the east. The signal was lost, but again picked up in the vicinity of a pair of sewer pipes that were previously marked by the City of Portland (Figure 2). This catch basin appears connected to the City of Portland's sewer system and not to the suspect circular features described in Section 5.1.6. The geophysical survey corroborates the information obtained from Mr. Hyatt in an interview conducted during our Phase I ESA. Mr. Hyatt indicated that the City of Portland has records of catch basins permitted on the Property that connect to the Property's sewer line and likely discharge to the City of Portland's combined sewer system.

5.1.6 Suspect Circular Features – Main Parking Lot

The results of the geophysical survey conducted in the vicinity of the circular features near the east-central portion of the main parking lot did not identify reflections from buried objects similar to drywells.

Upon completion of the survey in the vicinity of the above features, a suspect circular access port was observed in the sidewalk adjacent north of the Property. The lid to the access port could not be opened. Reflections typical of rebar above a void were observed. A vaulted basement extending beneath the sidewalk spanning the structure's facade may be present. It is possible the port is a coal (or similar fuel) chute or access for a possible tank in the basement or beneath the access port. GeoDesign personnel did not observe the presence of an AST in the basement.

5.2 SUBSURFACE INVESTIGATION - SOIL

The direct-push borings were advanced using drilling equipment owned and operated by ESN Northwest, Inc. of Olympia, Washington, to depths between 15 and 20 feet BGS (except for borings DP-4, DP-14, DP-16, and DP-17). Boring DP-4 was advanced to a depth of 30 feet BGS to evaluate deeper native soil conditions. Borings DP-14 and DP-16 were advanced to a depth of 14 feet BGS, and boring DP-17 was advanced to a depth of 2 feet BGS, where it met refusal (possible utility). The borings were located to evaluate potential releases from the USTs, and subsurface conditions beneath the exterior portions of the Property (including the USTs and the suspect circular features near the east-central portion of the Property) and beneath the interior portions of the Property structure (including the basement and main floor of the structure and near the interior floor drains).

A GeoDesign representative observed the drilling activities and collected soil samples from the borings for field screening purposes and potential chemical analysis (excluding DP-17). Field screening included visual observation, water sheen screening, and headspace vapor screening using a hand-held PID. Field screening evidence of contamination was not observed in soil collected from the borings. Field screening results for the soil samples collected from the direct-push borings are shown on the boring logs presented in Appendix A. A description of our field exploration program is also summarized in Appendix A.

5.2.1 Subsurface Conditions

In general, subsurface conditions at the Property consist of alluvial clay, sand, and gravel underlying exterior AC pavement or interior concrete floor slabs. The AC pavement located at

the surface of the exterior borings was 3 to 6 inches thick. The concrete floor slabs at the locations of the interior borings was 4 to 12 inches thick. Some borings in the main parking lot encountered 3 to 18 inches of aggregate base underlying the AC and up to 7 inches of aggregate base in the small parking lot/loading dock area. Approximately 12 and 19 inches of pea gravel was encountered beneath the concrete floor slab at the locations of borings DP-13 and DP-17, respectively.

Alluvial clay and sand (with varying amounts of silt) were encountered underlying the AC pavement, concrete floor slab, and/or fill (aggregate base and pea gravel) to the maximum depths explored (with the exception of boring DP-17, which met refusal at 2 feet BGS, due to an unidentified obstruction). Trace organics were observed in the alluvial silty sand at depths of 2.5 and 8 feet BGS in boring HA-1. Groundwater was not encountered in the borings but was measured at depths between 34.1 and 35.1 feet BGS in a vibrating wire piezometer installed during our geotechnical investigation in March and April 2019.

5.2.2 Soil Sampling

Up to three soil samples were collected from borings DP-1 through DP-16, HA-1, and HA-2. A total of 41 soil samples were collected from the borings and submitted to Apex Laboratories (Apex) of Tigard, Oregon, under standard chain-of-custody protocols for one or more of the following analysis:

- Hydrocarbon identification by Method NWTPH-HCID
- VOCs by EPA Methods 5035A/8260C
- PCBs by EPA Method 8082A
- RCRA 8 total metals by EPA Method 6020A (ICP-MS)
- Leachable lead by EPA Methods 1311/6020A (ICP-MS)
- PAHs by EPA Method 8270D SIM

Soil sample designations and sample depths are shown in Tables 1 through 5. The chemical analytical program details, laboratory reports, and chain-of-custody documentation are presented in Appendix C.

5.3 SUBSURFACE INVESTIGATION – SOIL GAS

Two soil gas borings (SG-1 and SG-2) were advanced with equipment owned and operated by ESN Northwest, Inc. of Olympia, Washington. The soil gas samples were collected from the borings at approximately 15 feet BGS. The soil gas samples were submitted to PACE Analytical of Mount Juliet, Tennessee, for analysis of gasoline-range hydrocarbons and VOCs by EPA Method TO-15. The soil gas sample designations and chemical analytical data are summarized in Table 6. The chemical analytical program details, laboratory report, and chain-of-custody documentation are presented in Appendix C.

5.4 SUBSURFACE INVESTIGATION –SUB-SLAB VAPOR

One sub-slab vapor samples (SV-1) was collected with equipment owned and operated by GeoDesign. The sub-slab vapor sample was collected immediately beneath the concrete floor slab in the basement of the Property structure. The sub-slab vapor sample was submitted to PACE Analytical of Mount Juliet, Tennessee, for analysis of gasoline-range hydrocarbons and

VOCs by EPA Method TO-15. The sub-slab vapor sample designation and chemical analytical data are summarized in Table 6. The chemical analytical program details, laboratory report, and chain-of-custody documentation are presented in Appendix C.

6.0 REGULATORY SCREENING LEVELS

A conceptual site model was not prepared for the project as part of this assessment. However, as described above, GeoDesign understands that redevelopment will include demolition of the existing on-site commercial structure and construction of a new mixed-use, seven-story structure with one level of underground parking on the west side of the structure and two levels of underground parking on the east side of the structure. The ground floor level (first floor above the parking levels) will include retail spaces and apartment units. The second through seventh levels will consist of apartment units. We also understand that groundwater beneath the Property will not be used as a drinking water source in the foreseeable future and the future redevelopment will likely include excavation and off-site disposal of subsurface soil.

Considering the redevelopment plans for the Property, the following DEQ RBCs were selected for comparison of soil, groundwater, and soil gas chemical analytical results obtained during this assessment:

- *Soil Ingestion, Dermal Contact, and Inhalation:* occupational, construction worker, and excavation worker receptors
- *Volatilization to Outdoor Air:* occupational receptors
- *Vapor Intrusion into Buildings:* occupational receptors

The DEQ *Leaching to Groundwater* RBCs are not used for comparison purposes as the *Leaching to Groundwater* exposure pathway is not considered complete due to the fact that the City of Portland provides potable water to the Property and the surrounding properties.

Soil chemical analytical results are compared to DEQ *Soil Ingestion, Dermal Contact, and Inhalation* RBCs for occupational, construction worker, and excavation worker receptors and to DEQ *Volatilization to Outdoor Air* and *Vapor Intrusion into Buildings* RBCs for occupational receptors in Tables 1 through 5. Soil gas and sub-slab vapor chemical analytical results are compared to DEQ *Vapor Intrusion into Buildings* RBCs for occupational receptors in Table 6.

To facilitate characterization of soil for disposal purposes, soil chemical analytical results were also compared to established DEQ CFSLs, updated February 21, 2019. Soil containing chemical constituents at concentrations below the DEQ CFSLs can be re-used on site or disposed of off site without restrictions. Soil containing chemical constituents at concentrations greater than DEQ CFSLs must be managed as solid waste and disposed of at a RCRA Subtitle C or D landfill, or other appropriately permitted facility, if exported from the Property. In addition, as recommended in DEQ's internal management directive, updated on February 21, 2019, statistical analysis was used in cases where one or more analytes were detected at concentrations greater than DEQ CFSLs. As noted in the directive, the calculation of a 90% UCL is often an appropriate statistical method to determine if the soil meets DEQ's clean fill criteria. The statistical software ProUCL was used for analysis to select the best-fit UCL based on sample size, data distribution,

and skewness. Soil chemical analytical results are compared to the applicable DEQ CFSLs in Tables 1 through 5. The ProUCL-calculated 90% UCLs for select analytes are presented in Table 3. The ProUCL output data sheets for the calculated 90% UCLs are presented in Appendix D.

7.0 CHEMICAL ANALYTICAL RESULTS

7.1 SOIL SAMPLE ANALYTICAL RESULTS

A total of 41 soil samples were submitted for chemical analysis. A comparison of the soil sample chemical analytical results to applicable regulatory criteria is shown in Tables 1 through 5 and discussed below. The laboratory reports are presented in Appendix C.

7.1.1 Hydrocarbon Identification

Eleven[1] soil samples were qualitatively analyzed for hydrocarbon identification by Method NWTPH-HCID. Gasoline-, diesel-, and oil-range hydrocarbons were not qualitatively detected in the soil samples submitted for analysis.

7.1.2 VOCs

Each sample was analyzed for VOCs by EPA Methods 5035A/8260C. VOCs were not detected at concentrations above the laboratory MRLs in the soil samples submitted for analysis.

7.1.3 RCRA 8 Total Metals

Each sample was analyzed for RCRA 8 total metals by EPA Method 6020A (ICP-MS). Barium, chromium, mercury, selenium, and silver were either not detected at concentrations greater than the laboratory MRLs or were detected at concentrations less than applicable DEQ RBCs and CFSLs.

Arsenic was detected in each soil sample [with the exception of DP-7(1-2)] at concentrations ranging from 3.32 to 13.0 mg/kg, which are greater than the DEQ *Soil Ingestion, Dermal Contact, and Inhalation* RBCs for occupational receptors. In addition, the detected concentrations of arsenic in 16 of the 40 soil samples exceed the DEQ-established naturally occurring background concentration (the CFSL) for arsenic of 8.8 mg/kg. However, the calculated 90% UCL concentration for arsenic (8.039 mg/kg) is less than the DEQ CFSL of 8.8 mg/kg. Therefore, the arsenic concentrations in the soil will not present unacceptable risk to future receptors and do not necessitate the need for the soil to be managed as solid waste.

Cadmium was detected in each soil sample [with the exception of samples DP-7(1-2) and DP-8(1.5-2.5) at concentrations ranging from 0.318 to 1.08 mg/kg. The detected concentrations of cadmium are less than the applicable DEQ RBCs. However, the detected concentrations of cadmium in 24 of the 41 samples are greater than the DEQ-established naturally occurring background concentration (the CFSL) for cadmium of 0.63 mg/kg. The calculated 90% UCL concentration of cadmium (0.75 mg/kg) is slightly greater than the DEQ CFSL of 0.63 mg/kg. It is our professional opinion that the cadmium concentrations represent naturally occurring

[1] DP-5(8.5-9.5), DP-5(13-14), DP-6(8-9), DP-6(12.5-13.5), DP-7(6.5-7.5), DP-7(11.5-12.5), DP-11(10-11), DP-11(18-19), DP-12(12-13), DP-12(16-17), HA-1(15-15.5)

background conditions and by themselves do not necessitate the need for the soil to be managed as solid waste and do not pose an unacceptable risk to future users of the Property based on the following:

- The subsurface soil is native alluvium and there is no known source for the elevated cadmium.
- The detected concentrations of cadmium do not exhibit a high degree of variability.
- The calculated 90% UCL concentration of cadmium is only 16 percent greater than the DEQ CFSL of 0.63 mg/kg (a difference of 0.12 mg/kg).
- All detected cadmium concentrations are less than the most conservative DEQ RBCs.

Lead was detected in each of the samples at concentrations ranging from 3.06 to 194 mg/kg. The detected concentrations of lead are less than the applicable DEQ RBCs. However, the detected concentrations of lead in samples DP-4(0.5-1.5) and DP-5(1-2) are greater than the DEQ-established naturally occurring background concentration (the CFSL) for lead of 28 mg/kg. However, by excluding the lead concentration represented by sample DP-4(0.5-1.5) from the dataset, the calculated 90% UCL concentration of lead in the soil (12.34 mg/kg) is less than the DEQ CFSL of 28 mg/kg. Therefore, the lead concentrations in the soil (with the exception of the soil represented by sample DP-4(0.5-1.5) do not necessitate the need for the soil to be managed as solid waste.

Soil at and in the vicinity of sample DP-4(0.5-1.5) should be temporarily stockpiled and characterized to evaluate disposal options. Confirmation soil samples should be collected from the excavation limits to confirm lead exceeding CFSL is no longer present.

7.1.4 Leachable Lead

Since soil sample DP-4(0.5-1.5) exhibited a lead concentration exceeding the EPA threshold limit of 100 mg/kg, this sample was also submitted for TCLP lead analysis by EPA Methods 1311/6020A (ICP-MS). The TCLP analysis simulates the leaching action of water seeping through waste in a landfill. If the concentration of the contaminant (in this case lead) is greater than EPA's TCLP limit (5.0 mg/L), the waste is considered a "toxicity characteristic" hazardous waste. TCLP lead was not detected at a concentration greater than the laboratory MRL (0.05 mg/L). Therefore, the lead-impacted fill at the location and depth of sample DP-4(0.5-1.5) does not have to be managed as hazardous waste.

7.1.5 PAHs

Each sample was submitted for analysis of PAHs by EPA Method 8270D SIM. PAHs were either not detected at concentrations greater than the laboratory MRLs or were detected at concentrations less than applicable DEQ RBCs and CFSLs.

7.1.6 PCBs

Each sample was submitted for analysis of PCBs by EPA Method 8082A. PCBs were not detected at concentrations greater than the laboratory MRLs.

7.2 SOIL GAS SAMPLE ANALYTICAL RESULTS

A comparison of the soil gas sample chemical analytical results to applicable regulatory criteria is shown in Table 6 and discussed below. The laboratory report is presented in Appendix C.

7.2.1 Gasoline-Range Hydrocarbons

Soil gas samples SG-1(15) and SG-2(15) were submitted for analysis of gasoline-range hydrocarbons by EPA Method TO-15. Gasoline-range hydrocarbons were not detected above the laboratory MRL in soil gas sample SG-1(15). Gasoline-range hydrocarbons were detected in soil gas sample SG-2(15) at a concentration of 454 µg/m^3. The detected concentration of gasoline-range hydrocarbons is less than the applicable DEQ RBCs.

7.2.2 VOCs

Soil gas samples SG-1(15) and SG-2(15) were submitted for analysis of VOCs by EPA Method TO-15. VOCs were either not detected in the soil gas samples at concentrations greater than the laboratory MRLs or were detected at concentrations ranging from 1.89 µg/m^3 [styrene in sample SG-2(15)] to 60.8 µg/m^3 [acetone in sample SG-2(15)]. The detected concentrations of VOCs are less than the applicable DEQ RBCs.

7.3 SUB-SLAB VAPOR SAMPLE ANALYTICAL RESULTS

A comparison of the sub-slab vapor sample chemical analytical results to applicable regulatory criteria is shown in Table 6 and discussed below. The laboratory report is presented in Appendix C.

7.3.1 Gasoline-Range Hydrocarbons

Sub-slab vapor sample SV-1 was submitted for analysis of gasoline-range hydrocarbons by EPA Method TO-15. Gasoline-range hydrocarbons were not detected above the laboratory MRL in sub-slab vapor sample SV-1.

7.3.2 VOCs

Sub-slab vapor sample SV-1 was submitted for analysis of VOCs by EPA Method TO-15. VOCs were either not detected in the sub-slab vapor sample at concentrations greater than the laboratory MRLs or were detected at concentrations ranging from 1.12 µg/m^3 (chloromethane) to 104 µg/m^3 (acetone). The detected concentrations of VOCs are less than the applicable DEQ RBCs.

8.0 CONCLUSIONS AND RECOMMENDATIONS

GeoDesign conducted a Phase II ESA of the Property to evaluate the nature and extent of chemical constituents in media at the Property. The Phase II ESA scope of services was developed to evaluate the RECs identified during the Phase I ESA and to confirm the presence or absence of the on- and off-site USTs and the potential drywell. In addition, the Phase II ESA was conducted to evaluate the soil with respect to risk to human health (by comparison to DEQ RBCs) and with respect to DEQ CFSLs to estimate the quantity of soil that may need to be disposed of as solid waste if exported during future redevelopment. Based on the results of the Phase II ESA, the following can be concluded:

- In general, historical use of the Property does not appear to have introduced chemical constituents to subsurface soil or soil gas beneath the Property with the exception of the potential for petroleum hydrocarbons in limited areas near former USTs. In the event field screening evidence of petroleum hydrocarbons in soil is encountered in these areas during construction, the contractor should cease work in the area of the discovery and notify Mill Creek Residential Trust so that the soil can be managed appropriately.
- Metals, with the exception of lead detected in one soil sample, were generally detected at concentrations either less than the laboratory MRLs or at concentrations representative of naturally occurring background conditions. Provided the soil does not exhibit field screening evidence of petroleum contamination (odor, staining, sheen, and/or elevated PID readings) during construction, the majority of the subsurface soil appears suitable for management as clean fill with the exceptions of the following:
- Lead was detected in in soil sample DP-4(0.5-1.5) at a concentration above the DEQ CFSL, but less than applicable DEQ RBCs. Further delineation of lead in the area of sample DP-4(0.5-1.5) has recently been conducted. Results of the supplemental sampling activities will be reported under separate cover and incorporated into the SWMP. Soil generated from this area during construction may need to be temporarily stockpiled and characterized to evaluate disposal options.
- Arsenic and cadmium were detected in select samples at concentrations above DEQ CFSLs, but within typical naturally occurring concentrations for the area. The calculated 90% UCL for arsenic (8.039 mg/kg) is below the DEQ CFSL of 8.8 mg/kg. The calculated 90% UCL concentration for cadmium (0.75 mg/kg) is slightly greater than the DEQ CFSL of 0.63 mg/kg. Based on the low levels detected, the lack of source of arsenic and cadmium, and general low variability of the detected concentrations in the native soil, it is our opinion that the arsenic and cadmium concentrations are representative of naturally occurring background concentrations. Based on these results, it is GeoDesign's opinion that the detected concentrations of arsenic and cadmium in the soil at the Property do not present unacceptable risk to future receptors or necessitate the need for the soil to be managed as solid waste.
- The geophysical survey confirmed the presence of two known off-site USTs (beneath the adjacent sidewalk south of the Property) and one known on-site decommissioned in-place UST (east of the Property structure in the main parking lot). These known USTs should be decommissioned by removal by a licensed UST service provider in accordance with current applicable DEQ rules and regulations.
- Although the geophysical survey did not indicate the presence of additional USTs, the possible presence of additional USTs at the Property cannot be fully ruled out. In the event an undocumented UST is encountered during construction, the contractor should cease work in the area of the discovery and notify Mill Creek Residential Trust and the City of Portland so the UST can be decommissioned by a licensed UST service provider in accordance with current applicable DEQ rules and regulations. Additional soil sampling and characterization of soil maybe necessary based on field observation during decommissioning.
- The geophysical survey did not confirm the presence of drywells on site. However, if drywells are encountered at the Property during construction, the drywells should be decommissioned in accordance with state and local regulations.

Based on the findings of the Phase II ESA, GeoDesign recommends the preparation of a SWMP to provide protocol for the management of soil at the Property during redevelopment. The SWMP will consist of the following elements:

- Description of known soil conditions
- Guidance on how to identify suspect soil
- Identification of actions to be taken if suspect soil is encountered
- Description of how to manage stockpiled soil, if needed
- A description of proper management and disposal of soil
- Protocols for the collection of soil samples for characterization purposes, as warranted

As a contingency, the SWMP will include appropriate UST management protocols, if encountered during construction.

9.0 LIMITATIONS

This report has been prepared for Mill Creek Residential Trust. This report is not intended for use by others, and the information contained herein is not applicable to other sites. Reliance by other parties must be approved by GeoDesign, Inc. in accordance with our standard contractual process for third-party reliance. Our interpretations of subsurface conditions are based on data from select soil, groundwater, and soil gas and sub-slab vapor samples collected from this limited area. The results of the analyses only indicate the presence or absence of those chemical constituents analyzed in those discrete sample locations. It is always possible that chemical constituents could exist between the widely spaced exploration locations. Analytical data from the laboratory samples should only be considered as indicators of Property conditions and not a guarantee of the absence of subsurface impact in areas not sampled.

The conclusions presented in this report are based on our observations made during field investigations and chemical analytical data. The findings of this assessment should be considered as a professional opinion based on our evaluation of selected and limited data.

Our services have been executed in accordance with the generally accepted practices in this area at the time this report was prepared. No warranty or other conditions, express or implied, should be understood.
