

# Technical Memorandum

To: Kara Master, Oregon DEQ Date: October 23, 2024

From: Chris Clough, Maul Foster & Alongi Project No.: M0785.31.001  
Julie Pace, Maul Foster & Alongi

Re: Limited Pre-Renovation Hazardous Building Materials Survey – Burns Armory

Maul Foster & Alongi, Inc. (MFA) prepared this Sampling Memorandum to present the purpose, scope of work, field findings, and analytical results from the limited hazardous building materials (HBM) assessment performed at the Burns Armory at 618 S Fairview Avenue in Burns, Oregon (the Site; Figures 1 and 2). The HBM assessment included asbestos-containing building materials (ACM) survey and inspection for lead-based paints (LBP).

## Purpose

An approximately 13,000-square-foot armory building and 3,500-square-foot shed structure are present at the Site. The main building was reportedly constructed in 1955<sup>1</sup> and the shed in the 1950s<sup>2</sup>. The main building is two stories and is constructed with brick, concrete, and reinforced plaster. The building includes office and storage rooms, common areas, a classroom, a dining area, a kitchen, mechanical and custodial rooms, restrooms, and a central gymnasium. The shed is a single-story metal and concrete structure with an unfinished interior.

The Site was formerly owned and operated by the Oregon Military Department. The Burns Piute Tribe leased the Site prior to purchasing it in 2024. The Site is currently used by the Burns Paiute Tribe to house its information technology (IT) network and as a community wellness center. According to prior assessment documents, the main building is slated for renovation and the shed is slated for full demolition.

To perform this assessment, Harney County used awarded funding from a U.S. Environmental Protection Agency (EPA) Brownfield Coalition Assessment Grant (Cooperative Agreement #BF-01J86601). Oregon Department of Environmental Quality (DEQ), through an intergovernmental agreement (IGA) with Harney County, contracted assessment activities to an existing on-call environmental contractor, MFA.

## Scope of Work

The project scope of work included the following tasks:

<sup>1</sup> PBS. 2024a. Limited Pre-Renovation Hazardous Materials Report, Burns Armory Building 618 S. Fairview Avenue, Burns, Oregon 97720. PBS Engineering and Environmental Inc., January 25.

<sup>2</sup> PBS. 2024b. Pre-Demolition Hazardous Materials Survey Report, Burns Armory Shed 654 W. Filmore Street, Burns, Oregon 97720. PBS Engineering and Environmental Inc., January 25.

October 23, 2024

- Conduct a limited inspection of the armory building including the roof exterior for suspected ACM. The prior survey was unable to access some of the roofing levels and presumed asbestos was present which was a data gap.
- Collect bulk samples of suspected ACM in accordance with applicable regulations and industry-standard guidelines for conducting hazardous building materials surveys.
- Field measurement of painted surfaces, likely to be impacted by planned renovations, for the presence of lead using an X-ray fluorescence (XRF) device.
- Measure and assess impacts of bird droppings on the shed structure interior.
- Submit suspected ACM bulk samples to a qualified laboratory for analysis.
- Prepare a memorandum documenting the survey findings (this document).

## Field Activities and Findings

### Preparatory Activities

MFA completed the following preparatory activities prior to conducting field activities on the Site:

**Laboratory Identification and Selection.** Based on communications with DEQ's contract laboratory, it was determined that the selection of an outside laboratory to perform the hazardous building materials analysis would minimize analysis time and reduce costs for sample analysis. Based on recent experience on completed projects, demonstrated ability to meet expedited turnaround times, and pricing for laboratory analyses, MFA selected NVL Laboratories (NVL) of Seattle, Washington for hazardous building materials analyses. NVL is a Minority Business Enterprise (MBE) that holds certifications to analyze asbestos in bulk materials.

**Site Health and Safety Plan.** MFA prepared a site-specific health and safety plan (HASP) for the performance of these sampling activities. The HASP was prepared in general accordance with the Occupational Safety and Health Act and Oregon Administrative Rules. A copy of the HASP was maintained on site for use by MFA staff during the field activities and was submitted to DEQ as Appendix A of the Sampling and Analysis Plan<sup>3</sup>.

**Site Access and Work Notification.** MFA coordinated Site access with Burns Paiute Tribe representatives and notified DEQ of the proposed work schedule. The performance of the field efforts for this project was delayed due to nearby wildfire conditions that impacted air quality and the availability of owner representatives to provide access to the Site.

**Roofing Repair Contractor Coordination.** In addition to Burns Paiute Tribe and DEQ notifications, MFA coordinated with a local roofing contractor to provide additional Site access equipment and to perform repair patching after collection of survey samples.

**Equipment Rental.** MFA rented an XRF device, certified and calibrated to measure lead, including buried paint layers. In accordance with operating instructions and standard industry guidance, the equipment was calibrated before each survey, every four hours during operation of the equipment, and at the end of each survey to ensure the accuracy of the field measurements. The calibration measurements were reviewed and were within operation standards to consider the collected data valid for the survey.

## Asbestos Sampling

On August 17, 2024, a site inspection and asbestos survey was performed by Julie Pace, a certified Asbestos Hazard Emergency Response Act (AHERA) inspector (certificate in Attachment A). The survey included a complete visual survey of the accessible roof areas of the main building and shed structures to identify suspected ACM prior to renovation activities. Suspect materials were cataloged and tracked. Bulk building material samples were collected from each of the suspect materials, as appropriate, using industry-standard sampling techniques and sampling procedures were consistent with the AHERA protocol outlined in 40 Code of Federal Regulations (CFR) 763, Oregon Administrative Rules Chapter 340, Division 248, and industry standards.

Julie Pace collected 13 samples in the main building and three samples in the shed, comprising a total of 29 individual layers of suspect ACM. These samples included roofing sealants, silver paint, tar, and cores completed through all roofing layers of the upper-most roof, wallboard, skim coats, joint compounds, adhesives, caulking, and cement board. Samples were collected using decontaminated equipment and placed into individually labeled plastic bags. Results, locations, and descriptions are included in Table 1. Photographs were taken of each sample and sampling location (Attachment B). Sample details were recorded in field notes, and a field figure was generated to document location information for each sample (Figure 2). The sampling procedures were followed to minimize the release of asbestos fibers. Roofing samples that penetrated the building envelope were repaired by a local roofing contractor. The samples were submitted to NVL for analysis under chain-of-custody protocols.

## Lead Paint Inspection

Julie Pace, a lead paint inspector and risk assessor, inspected the site for painted surfaces that are likely to be impacted by planned renovations and were not sufficiently sampled during the prior PBS Engineering (PBS) inspections.<sup>4</sup> Julie Pace's certificate is presented in Attachment A.

Representative painted surfaces were analyzed using an XRF. The XRF device presents the concentration of detected lead within each painted surface. MFA confirmed that the Site is not operating as a child-occupied facility, no housing is present, and there are no plans to convert this Site for these uses in the future. Based on these determinations, a limited pre-renovation paint survey was conducted in accordance with industry standards.

EPA (40 CFR 745) and the Oregon Health Authority define LBP as paint containing lead concentrations higher than 1 mg/cm<sup>2</sup> or 0.5 percent (by weight). Lead inspection results with a concentration at or above 1 mg/cm<sup>2</sup> are considered LBP, and detectable lead concentrations below 1 mg/cm<sup>2</sup> are considered lead-containing paint (LCP).

In the main building, LBP was identified in 36 of the 65 Site locations where XRF measurements were taken. LCP was identified in 33 of the 65 Site locations where XRF measurements were taken.

In the shed, LBP was identified in 1 of the 13 Site locations where XRF measurements were taken. LCP was identified in 12 of the 13 Site locations where XRF measurements were taken.

Sample details were recorded in field notes. Paint results, locations, and descriptions are included in Table 2. The full data set from the XRF is presented in Attachment C.

## Bird Dropping Measurement and Assessment

As part of the planned demolition of the shed structure, surfaces coated with bird droppings, that may present a human health hazard, will need to be addressed. During the Site inspection, Julie Pace made observations and collected measurements of the areas impacted by bird droppings. The bird droppings are on various surfaces, such as the concrete floor, gym equipment, a riding lawnmower, lockers, wrapped insulation, metal chairs, and furniture.

The thickness of the bird droppings ranges from 1 to 5 inches, covering most of the floor, estimated at 3,500 square feet. The back storage room was relatively unaffected. Photographs are included in Attachment B.

## Analysis and Results

Table 1 summarizes the asbestos laboratory results and field data about building material types, color, condition, and sample locations. Table 2 presents the data from the XRF for lead within painted surfaces. The locations of the asbestos samples are shown in the attached Figure 2. The laboratory analytical report is presented in Attachment D. The data are considered acceptable for their intended use.

The 16 ACM samples, from the main building and shed, were analyzed by polarized light microscopy, consistent with EPA Method 600/R-93/116.

In OAR 340-248-0010, the Oregon Department of Environmental Quality defines ACM as materials that contain more than 1 percent asbestos by weight.

## Laboratory Asbestos Results

Asbestos was detected in 8 of the 16 samples: AB-06, AB-07, AB-11, AB-12, AB-13, AS-01, AS-02, and AS-03. Descriptions of these materials are presented in Table 1 and summarized below:

### Armory Main Building

- Layer 2 of sample AB-06 contained 14 percent chrysotile asbestos. The laboratory described this layer as black asphaltic material. Based on field observations it is believed that this layer is a sealant on the upper rooftop vents.
- Layer 1 of sample AB-07 contained 16 percent chrysotile asbestos. The laboratory described this layer as black asphaltic material. Based on field observations it is believed that this layer is a tar.
- Sample AB-11 contained 14 percent chrysotile asbestos. The laboratory described this layer as gray, loose, crumbly material with layered paint. Based on field observations it is believed that this material is cement board soffit (transite).
- Layers 1 and 2 of sample AB-12 contained 3 and 4 percent chrysotile asbestos, respectively. The laboratory described these layers as off-white compacted powdery material with paint, and off-white compacted powdery material with paper. This sample is the layers of wallboard, skim coat, and joint compound.
- Layer 1 of sample AB-13 contained 5 percent chrysotile asbestos. The laboratory described these layers as off-white compacted powdery material with paint. This sample is the layers of wallboard, skim coat, and joint compound.

October 23, 2024

## Armory Shed

- Sample AS-01 contained 11 percent chrysotile asbestos. The laboratory described this layer as black asphaltic material with debris. Based on field observations it is believed that this material is a mastic.
- Sample AS-02 contained 14 percent chrysotile asbestos. The laboratory described this layer as black asphaltic material with debris. Based on field observations it is believed that this material is a mastic.
- Sample AS-03 contained 32 percent chrysotile asbestos. The laboratory described this layer as black asphaltic material with debris. Based on field observations it is believed that this material is a fibrous sealant and is located on the rooftop flashing. It is also assumed that this material is homogeneous with the mastic along the exterior shed panels that were previously identified in the 2024 PBS report (Attachment F).

## XRF Results

### Armory Main Building

Lead was detected in 68 of the 79 samples in this building. Thirty-five (35) of these were greater than 1.0 mg/cm<sup>2</sup>, which classifies it as LBP. Thirty-three (33) samples are lead-containing because lead was detected, but the concentration was below the regulatory threshold of 1.0 mg/cm<sup>2</sup>.

### Armory Shed

Lead was detected in 13 of the 13 samples in this building. One (1) of these was greater than 1.0 mg/cm<sup>2</sup>, which classifies it as LBP. Twelve (12) samples are lead-containing because lead was detected, but the concentration was below the regulatory threshold of 1.0 mg/cm<sup>2</sup>.

## Recommended Response Actions

This report should be made available to contractors during bidding on abatement, construction, or renovation work that will be conducted on the structures listed above. A summary of regulated ACM and LBP surveyed by MFA and PBS is included in Table 3 and presented on Figures 3 through 5.

Based on the presence of ACM and LBP present at the Site, the identified hazardous building materials should be abated by a licensed contractor or safely managed in place consistent with a written operations and maintenance plan to prevent human exposure or release to the environment. Please note that this survey document does not meet the requirements of an abatement specification.

LBP and LCP should be handled appropriately during abatement, renovation, and demolition consistent with the Oregon Occupational Safety and Health Administration lead requirements in OAR 1926.62. To ensure that proper best management practices are followed during demolition, MFA recommends that the contractor has lead certification and/or training. Licensed abatement contractors are not required to remove LCP; however, they should have the training, including monitoring experience, to ensure that workers are not exposed to lead during construction projects and to minimize potential releases to the environment.

Asbestos bulk samples with trace detections of asbestos fibers (e.g., < 1%) are not considered ACM, and therefore, are not regulated by EPA and DEQ. However, these materials may still contain asbestos. Contractors should be aware that OR-OSHA has requirements to protect workers that disturb these materials during construction activities.

October 23, 2024

Contractors should also be informed that other hazardous materials or conditions may be discovered during the renovation and/or demolition activities. Contractors should presume that any materials not described in this report and previous reports are potentially hazardous and should be inspected and sampled before they are disturbed.

As required by the State of Oregon Asbestos Rules, contact information for the Inspector and Property Owner are provided below.

## Analytical Laboratory Reports

MAUL  
FOSTER  
ALONGI

August 23, 2024

Chris Clough  
Maul Foster & Alongi - Portland  
3140 NE Broadway  
Portland, OR 97232

**RE: Bulk Asbestos Fiber Analysis; NVL Batch # 2414973.00**

Client Project: M0785.31.001-004  
Location: Burns, Oregon

Dear Mr. Clough,

Enclosed please find test results for the 16 sample(s) submitted to our laboratory for analysis on 8/20/2024.

Examination of these samples was conducted for the presence of identifiable asbestos fibers using polarized light microscopy (PLM) with dispersion staining in accordance with **U. S. EPA 40 CFR Appendix E to Subpart E of Part 763**, Interim Method for the Determination of Asbestos in Bulk Insulation Samples and **EPA 600/R-93/116**, Method for the Determination of Asbestos in Bulk Building Materials.

For samples containing more than one separable layer of materials, the report will include findings for each layer (labeled Layer 1 and Layer 2, etc. for each individual layer). The asbestos concentration in the sample is determined by calibrated visual estimation.

For those samples with asbestos concentrations between 1 and 10 percent based on visual estimation, the EPA recommends a procedure known as point counting (NESHAPS, 40 CFR Part 61). Point counting is a statistically more accurate means of quantification for samples with low concentrations of asbestos.

The detection limit for the calibrated visual estimation is <1%, 400 point counts is 0.25% and 1000 point counts is 0.1%

Samples are archived for two weeks following analysis. Samples that are not retrieved by the client are discarded after two weeks.

Thank you for using our laboratory services. Please do not hesitate to call if there is anything further we can assist you with.

Sincerely,

A handwritten signature in black ink, appearing to read 'Munaf Khan'.

Munaf Khan, President/Laboratory Director

Munaf Khan, President/Laboratory Director

Note: If samples are not homogeneous, then subsamples of the components were analyzed separately. All bulk samples are analyzed using both EPA 600/R-93/116 and EPA 40 CFR Appendix E to Subpart E of Part 763 with the following measurement uncertainties for the reported % Asbestos (1%=0-3%, 5%=1-9%, 10%=5-15%, 20%=10-30%, 50%=40-60%). This report relates only to the items tested. If sample was not collected by NVL personnel, then the accuracy of the results is limited by the methodology and acuity of the sample collector. This report shall not be reproduced except in full, without written approval of NVL Laboratories, Inc. It shall not be used to claim product endorsement by NVLAP or any other agency of the US Government

**RE: Bulk Asbestos Fiber Analysis; NVL Batch # 2416300.00**

Client Project: M0785.31.001-004  
Location: Burns, Oregon

Dear Mr. Clough,

Enclosed please find test results for the 2 sample(s) submitted to our laboratory for analysis on 9/9/2024.

Examination of these samples was conducted for the presence of identifiable asbestos fibers using polarized light microscopy (PLM) with dispersion staining in accordance with **U. S. EPA 40 CFR Appendix E to Subpart E of Part 763**, Interim Method for the Determination of Asbestos in Bulk Insulation Samples and **EPA 600/R-93/116**, Method for the Determination of Asbestos in Bulk Building Materials.

For samples containing more than one separable layer of materials, the report will include findings for each layer (labeled Layer 1 and Layer 2, etc. for each individual layer). The asbestos concentration in the sample is determined by calibrated visual estimation.

For those samples with asbestos concentrations between 1 and 10 percent based on visual estimation, the EPA recommends a procedure known as point counting (NESHAPS, 40 CFR Part 61). Point counting is a statistically more accurate means of quantification for samples with low concentrations of asbestos.

The detection limit for the calibrated visual estimation is <1%, 400 point counts is 0.25% and 1000 point counts is 0.1%

Samples are archived for two weeks following analysis. Samples that are not retrieved by the client are discarded after two weeks.

Thank you for using our laboratory services. Please do not hesitate to call if there is anything further we can assist you with.

Sincerely,

A handwritten signature in black ink, appearing to read 'Munaf Khan'.

Munaf Khan, President/Laboratory Director

**Importance:** High

Hello Client Services,

I would like to request a follow up analysis of a couple of samples from the M0785.31.001-004 (2414973.00) report. Please see the requests below and let me know if you have any questions.

- Composite the layers within Sample AB-12 and reanalyze the composited mixture.
- Composite the layers within Sample AB-13 and reanalyze the composited mixture.

What TAT would I need to select to get results Friday morning? Is that speed something you can accommodate?

Thanks!

Hello Client Services,

How long will these samples be in your possession? I am confirming with our client if we wish to perform any follow up reanalysis on these results.

Thanks!
