Date: Wednesday, September 3, 2025 3:22:30 PM

Hi Rebecca –

I looked through the workplan. Glad to see they are coordinating directly with FMC.

I think it looks good and will provide very helpful information.

My only recommendation is that they also run a couple of soil samples above 18' bgs in each boring in order to use the opportunity to get a comprehensive understanding of arsenic concentrations in the area immediately next to the in water contamination. Their current CSM is that the significant contamination is co-located with the bottom of the launch ways. If they are trying to increase certainty that the Gunderson uplands are not a source of arsenic in-water, having results from the fill above the waterline would be informative.

- Josie

Hi Laura and Josie,

We received a Supplemental Investigation work plan for the MW-82 area for the Gunderson LLC site (ECSI# 1155). DEQ is currently reviewing the document and compiling comments, but the Gunderson team is hoping to implement the work plan under an aggressive schedule. They are hoping to get the first round of sampling completed by the end of this quarter/month. If you could provide your feedback as soon as possible, that would be appreciated. I am hoping to get the letter back to them by September 12th at the latest but sooner is better if we can make it happen.

Thank you,

Rebecca Digiustino
